Symbols and Abbreviations

The following symbols and abbreviations, and others approved for the Système International d'Unités (SI), are used without definition in the following reports by the Divisions of Sport Fish and of Commercial Fisheries: Fishery Manuscripts, Fishery Data Series Reports, Fishery Management Reports, and Special Publications. All others, including deviations from definitions listed below, are noted in the text at first mention, as well as in the titles or footnotes of tables, and in figure or figure captions.

Weights and measures (metric)		General		Measures (fisheries)	
centimeter	cm	Alaska Administrative Code	AAC	fork length	FL
deciliter	dL	all commonly accepted abbreviations	e.g., Mr., Mrs., AM, PM, etc.	mideye-to-fork	MEF
gram	g			mideye-to-tail-fork	METF

May 2007

The Division of Sport Fish Fishery Data Series was established in 1987 for the publication of technically oriented results for a single project or group of closely related projects. Since 2004, the Division of Commercial Fisheries has also used the Fishery Data Series. Fishery Data Series reports are intended for fishery and other technical professionals. Fishery Data Series reports are available through the Alaska State Library and on the Internet: <http://www.sf.adfg.state.ak.us/statewide/divreports/html/intersearch.cfm> This publication has undergone editorial and peer review.

ABSTRACT

The estimated total run of sockeye salmon *Oncorhynchus nerka* to Upper Cook Inlet (UCI) in 2004 was 7.9 million fish. The total estimate is comprised mainly of the commercial harvest of 4.9 million fish and the escapement estimate of 2.2 million fish into five major river systems. The remainder of the return consists of unmonitored escapements in “other” systems, sport, subsistence and personal use harvests. Commercial harvests and escapements that were sampled for sex, age, and length data represented 7.0 million of the returning sockeye and will be referred to as the monitored harvests and escapements. Age classes 1.2, 1.3, 2.2, and 2.3 comprised 99% of the combined UCI commercial sockeye salmon harvests and monitored escapements. Age class-1.3 represented 4.1 million fish or 58% of the total monitored return, while age-1.2 fish represented 1.1 million fish or 16% of the total monitored return. Average length for the four major age classes ranged from 490 mm for age-1.2 fish to 580 mm for age-1.3 fish. Female composition of sockeye salmon in the combined commercial harvests and escapements averaged 54%.

A total of 27,448 Chinook salmon *O. tshawytscha* were commercially harvested in UCI. The Upper Subdistrict eastside set gillnet harvest of 21,656 fish was the only harvest sampled and represented 79% of the total commercial harvest. Ages-1.1, -1.2, -1.3, and -1.4 fish comprised 99% of the harvest. Average length of the four major age classes ranged from 428 mm for age-1.1 fish to 1,010 mm for age-1.4 fish. Sex composition favored males at 56%.

The commercial harvest of coho salmon *O. kisutch* was 309,001 fish. Commercial gillnet harvests of coho that were monitored consisted of the drift fleet and Upper and General subdistricts, which represented 84% of the total commercial harvest. The harvest was comprised of age-1.1, -2.1, and -3.1 fish. Average lengths for the three age classes were 542 mm for age-1.1 fish, 570 mm for age-2.1 fish, and 595 mm for age-3.1 fish. For the three commercial fisheries, the female composition of coho salmon averaged 51%.

The commercial harvest of chum salmon *O. keta* was 145,129 fish. The drift gillnet harvest, which was the only harvest monitored, was 136,006 or 94% of the total. The harvest was comprised of age-0.2, -0.3, and -0.4 fish. Average lengths for the three age classes were 548 mm for age-0.2 fish, 589 mm for age-0.3 fish and 604 mm for age-0.4 fish. Female chum salmon contributed 51% to the harvest.

Key words: Salmon, *Oncorhynchus*, age, size, commercial catch, escapement, exploitation rate, Upper Cook Inlet, Alaska, Chinook, *O. tshawytscha*, sockeye, *O. nerka*, coho, *O. kisutch*, chum, *O. keta*

INTRODUCTION

Upper Cook Inlet (UCI) supports all 5 species of Pacific salmon *Oncorhynchus* (Figure 1). From 1974-2003 the average harvest of salmon in UCI was 4.6 million fish. The historic average harvest of sockeye salmon *O. nerka* was 3.3 million, with 0.8 million even-year pink *O. gorbuscha*, 0.1 million odd-year pink, 0.5 million chum *O. keta*, 0.4 million coho *O. kisutch*, and 17,000 Chinook *O. tshawytscha* salmon. Salmon harvests in UCI represent approximately 5% of the statewide commercial harvest (Fox and Shields 2004). Locations of the commercial fishing districts, subdistricts, and Upper Subdistrict beach fisheries are shown in Figures 2 and 3.

The pioneering work of Davis and Kissner (1969) in UCI provided a framework from which age, sex, and length data collection began. Unfortunately, in the early years (1964-1978) the sample collection of commercial harvest and escapement data was sporadic and limited compared to the present. Information was published in annual technical reports from 1964 to 1978 (Florey 1977; Litchfield 1983; Namtveldt et al. 1978; Nelson 1984). Davis and Tarbox (1985) produced a compendium of information for the period 1964-1981 to summarize the yearly results. The series continued with the advent of stock separation studies in 1978 and has been in existence ever since (Bethe et al. 1980; Cross et al. 1981, 1982, 1983, 1985, 1987; Cross 1985; Tobias and Tarbox 1999a, 1999b, 2000; Tobias and Waltemyer 1996; Tobias and Willette 2001, 2002, 2003, 2004; Waltemyer 1989, 1990, 1991, 1993, 1994a, 1994b, 1995a, 1995b; Waltemyer and Tobias 1997, 1998). The major emphasis has been on sampling sockeye salmon in the commercial

harvests and escapements. However, since 1983, Chinook, coho, and chum salmon sampling in key commercial harvests has been conducted.

Age, sex, and length information, in conjunction with abundance data, provides a basis for assessing yearly variations in production and effects of management strategies. This report is part of a continuing series. General objectives are: 1) document the number of salmon harvested in selected commercial gillnet fisheries; 2) report escapement numbers from the major river systems; and 3) estimate age, sex, and length composition of salmon in selected commercial harvests and escapements.

METHODS

NUMERICAL DATA

Commercial harvest statistics were compiled from Alaska Department of Fish and Game (ADF&G) final fish ticket information. All commercially harvested salmon, whether sold or kept for personal use, are recorded on fish tickets and entered into the statewide fish ticket database (Fox and Shields 2005).

ADF&G Commercial Fisheries personnel used Bendix Corporation¹ single beam side-scanning sonar to estimate the adult salmon escapement in the Kenai (1 July-18 August; River Mile 19), Kasilof (15 June-16 August; RM 10.5), Crescent (24 June-05 August; RM 1.5), and Yentna Rivers (7 July-12 August; RM 4.0) (Westerman and Willette 2003).

Sockeye salmon escapement in Fish Creek was determined by counting fish migrating through a weir located 3 miles upstream from the confluence with the Knik Arm of Cook Inlet. Sport Fish Division personnel in Palmer monitored sockeye escapement through the weir at Fish Creek from July 6 to August 16. Cook Inlet Aquaculture Association (CIAA) personnel monitored the sockeye salmon escapements through a weir on Hidden Creek from July 12 to August 30. Sport Fish Division personnel in Soldotna monitored escapements on the Russian River for late run sockeye salmon from July 15 to September 3.

AGE, SEX, AND SIZE DATA

Fish scales were taken from the left side of the salmon approximately two rows above the lateral line on the diagonal row that extends down from the posterior insertion of the dorsal fin to the anterior insertion of the anal fin (Koo 1955). One scale was collected from each sockeye and chum salmon. Because of the higher number of regenerated scales on coho and Chinook salmon, 3 scales were collected from each of these species. Scales were mounted on gum cards and impressions made in cellulose acetate as described by Clutter and Whitesel (1956).

Ages of salmon were determined by visual examination of scale impressions under moderate magnification (40X) using a microfiche viewer. Age was determined based upon criteria established by Mosher (1969) and Tobias et al. (1994). Ages were recorded in European notation (Koo 1962).

¹ Product names used in this report are included for scientific completeness, but do not constitute product endorsement by the Alaska Department of Fish and Game.

Sex and length information were recorded for all specimens sampled. Sex of the fish was determined by morphological characteristics. Length was measured from mideye to tail fork (METF), and recorded to the nearest millimeter for all species except Chinook salmon, which were measured to the nearest 5 millimeters. Chinook salmon were also checked for adipose fin clips to determine if they were coded wire tagged hatchery fish (Lafferty et al. 1998).

Age, sex, and length compositions of the commercial harvests were estimated using a stratified systematic random sampling design (Cochran 1977). A minimum sample size of 403 readable scales was determined for each species and strata to estimate the proportion of each major age class in the harvest within 5% of the true proportion 90% of the time (Thompson 1987). A sample size of 500 fish per strata for sockeye salmon harvested in the commercial fisheries was set to account for unreadable scales.

The sampling design of the commercial fishery harvests was stratified by date and area. Salmon were sampled from each of eight commercial fishing districts and subdistricts from one to ten times during the season. Frequency and priority of sampling was based on the historical harvest contribution of a fishery to the total UCI commercial harvest and, in some cases, defined by the current management strategy. In order to detect seasonal changes in age composition, sampling dates were selected based on historic data such as run timing for each species throughout the season.

For sockeye escapements, a weighted sample size of 500 fish was used to provide the same level of precision as the sampling in the commercial fishery. The 500 fish were sampled in proportion to the daily escapement. The percent of each day's escapement to be sampled was estimated based on the anticipated total escapement (i.e. 500 total samples/500,000 escapement estimate indicates 0.10% of each day's total count needs to be sampled). In addition to the weighted sample, 500 samples were taken during three time periods on the Kenai and Kasilof Rivers to estimate age composition through time. On the Kasilof, the three time periods were 15 June-10 July, 11-20 July, and 21-15 August; while the Kenai River sampling periods were 1-20 July, 21-30 July, and 31 July-18 August.

Sampling at North and South Kalifornsky beaches was similar to the sampling conducted in 2002, when both beaches were sampled throughout the fishery season, to estimate age compositions of harvests separately.

The offshore test fish boat personnel sampled their harvest for the third season in a row. The Offshore Test fishing program employs a chartered vessel which fishes along a transect crossing Cook Inlet from Anchor Point to the Red Delta River, to estimate run strength inseason (Shields and Willette 2005). Members of the crew collected age, sex, and length data from sockeye salmon caught at each station along the transect.

Resulting age compositions for each time-strata sampled were applied to the total harvest. Depending on the size of the harvest and number of times the fishery was sampled, each age composition may represent one fishing period or the entire season's harvest. Age-apportioned harvests were summed to calculate the total number of each age group harvested from each fishery and district.

RESULTS AND DISCUSSION

Age, sex, and length data were collected from a total of 1,707 Chinook, 29,511 sockeye, 1,644 coho, and 1,000 chum salmon from selected UCI commercial gillnet harvests and escapements in 2004 (Table 1). Summaries of these data, along with harvest and escapement information are presented below.

The 2004 UCI commercial salmon harvest of 5.8 million was the largest harvest since 1992 and approximately 1.1 million more than the 30-year (1974-2003) average (Fox and Shields 2005).

Sockeye Salmon

Total Return

The sockeye salmon total run to Upper Cook Inlet in 2004 was comprised of a commercial harvest of 4.9 million fish, and an estimated escapement of 2.6 million fish (Table 2). There were sport, personal use, and subsistence harvests below the counting sites on the rivers and in the Inlet that were estimated at 390,000. The estimated total run was 7.9 million sockeye in 2004.

The following four major age classes made up 99% of the monitored sockeye salmon commercial harvests and escapements (Table 3):

<u>Age Class</u>	<u>%</u>	<u>Escapement and Commercial Harvest</u>	<u>Mean Length (mm)</u>
1.2	16.2	1,134,038	490
1.3	58.5	4,101,562	580
2.2	12.7	893,874	495
2.3	11.4	800,059	575

The predominant age class percentages, numbers, and mean lengths of sockeye salmon in the UCI commercial harvest were:

<u>Age Class</u>	<u>%</u>	<u>Commercial Harvest</u>	<u>Mean Length (mm)</u>
1.2	14.5	705,368	495
1.3	60.9	2,957,322	583
2.2	11.7	568,543	498
2.3	11.6	564,126	578

The predominant age class percentages, numbers, and mean lengths of sockeye salmon in the monitored UCI escapements were:

<u>Age Class</u>	<u>%</u>	<u>Escapement</u>	<u>Mean Length (mm)</u>
1.2	19.8	428,670	481
1.3	53.0	1,144,240	572
2.2	15.1	325,331	490
2.3	10.9	235,933	570

Female contributions among all the age classes ranged from 46% to 56% in the commercial harvests and from 48% to 55% in the escapements (Table 3).

Commercial Harvest

The 2004 Central District sockeye salmon drift gillnet harvest (excluding Chinitna Bay) was 2,523,559 fish (Tables 3 and 4). This harvest represented 51% of the total UCI sockeye salmon

harvest. Historically, the drift harvest from 1974-2003 has averaged 56%. The major age class percentages, number of fish and mean lengths were:

<u>Age Class</u>	<u>%</u>	<u>Commercial Harvest</u>	<u>Mean Length (mm)</u>
1.2	10.4	261,862	510
1.3	69.9	1,764,339	590
2.2	6.2	157,211	515
2.3	11.9	301,163	586

Female composition in the drift gillnet harvest ranged from 45% (25-29 June) to 68% (4-5 July; Table 4).

The Cohoe/Ninilchik Beach set gillnet harvest was 637,864 fish and represented 13% of the total UCI sockeye salmon harvest (Tables 3 and 5). Historically, the Cohoe/Ninilchik fishery harvest averaged 14%. The Kasilof River Special Harvest Area set gillnet harvest of 4,904 fish was added to the Cohoe/Ninilchik harvest in this report. Therefore, the total adjusted harvest from the area was 642,768. The major age class percentages, number of fish, and mean lengths were:

<u>Age Class</u>	<u>%</u>	<u>Commercial Harvest</u>	<u>Mean Length (mm)</u>
1.2	28.6	183,645	485
1.3	36.1	232,205	557
2.2	25.4	163,199	488
2.3	9.4	60,201	549

Female composition in the Cohoe/Ninilchik Beach sockeye salmon harvest ranged from 44% (29 June-1 July, 23-29 July) to 58% (8-11 July; Table 5).

The Kalifornsky Beach set gillnet harvest, which historically averaged 13% of the total UCI sockeye salmon harvest, represented 13% or 659,288 fish in 2004. The harvest consisted of 303,164 from North Kalifornsky Beach and 356,124 fish from South Kalifornsky Beach (Tables 3, 6, 7 and 8).

The four major age class percentages, number of fish, and mean lengths in the North Kalifornsky Beach harvest were:

<u>Age Class</u>	<u>%</u>	<u>Commercial Harvest</u>	<u>Mean Length (mm)</u>
1.2	16.5	50,115	488
1.3	56.1	169,975	577
2.2	15.9	48,103	490
2.3	10.6	32,152	572

The female composition of the North Kalifornsky Beach sockeye salmon harvest ranged from 44% (31 July - 7 August) to 54% (12 July; Table 6).

The four major age class percentages, number of fish, and mean lengths in the South Kalifornsky Beach sockeye salmon harvest were:

<u>Age Class</u>	<u>%</u>	<u>Commercial Harvest</u>	<u>Mean Length (mm)</u>
1.2	27.4	97,458	479
1.3	36.2	129,026	566
2.2	27.3	97,271	481
2.3	8.5	30,412	555

The female composition in the South Kalifornsky Beach sockeye salmon harvest ranged from 43% (8-9 July) to 60% (14-16 July) (Table 7).

Overall, South Kalifornsky Beach harvested more age-1.2 sockeye salmon (27%) than North Kalifornsky Beach (17%). North Kalifornsky Beach harvested more age-1.3 sockeye salmon (56%) than South Kalifornsky Beach (36%). This trend occurred throughout the sampling dates (Figure 4).

The four major age class percentages, number of fish, and mean lengths in the combined Kalifornsky Beach harvests were:

<u>Age Class</u>	<u>%</u>	<u>Commercial Harvest</u>	<u>Mean Length (mm)</u>
1.2	22.4	148,894	482
1.3	45.2	298,281	573
2.2	22.1	145,657	484
2.3	9.5	62,713	565

Female composition in the combined Kalifornsky Beach sockeye salmon harvest ranged from 47% (25 June-1 July) to 55% (17-19 July; Table 8).

The Salamatof Beach/East Forelands set gillnet sockeye salmon harvest, which historically averaged 12% of the total UCI sockeye salmon harvest, represented 19% or 932,314 fish in 2004 (Tables 3 and 9). The four major age class percentages, number of fish, and mean lengths were:

<u>Age Class</u>	<u>%</u>	<u>Commercial Harvest</u>	<u>Mean Length (mm)</u>
1.2	10.4	96,936	496
1.3	66.7	621,574	578
2.2	9.0	83,662	509
2.3	12.9	120,064	580

Female composition in the Salamatof Beach harvest ranged from 45% (1-7 August) to 59% (12 July; Table 9).

Of the four Upper Subdistrict beach fisheries sampled, sockeye salmon harvested in the South Kalifornsky and Coho/Ninilchik beaches were smallest in total mean length (518 mm) while sockeye salmon in the Salamatof Beach harvest were the largest (564 mm). North Kalifornsky Beach sockeye salmon mean length was 548 mm.

Figures 5-8 show trends in composition of age-1.3, -2.3, -1.2, and -2.2 sockeye salmon through time in the Central District drift gillnet and Upper Subdistrict (Salamatof, North and South Kalifornsky beaches and Cohoe/Ninilchik beaches) set gillnet harvests.

The Eastern Subdistrict sockeye salmon set gillnet harvest of 12,987 fish, which historically averaged 1.1% of the total UCI sockeye salmon harvest, represented 0.3% in 2004 (Tables 3 and 10). The major age class percentages, number of fish, and mean lengths were:

<u>Age Class</u>	<u>%</u>	<u>Commercial Harvest</u>	<u>Mean Length (mm)</u>
1.2	27.2	3,534	479
1.3	39.5	5,126	564
2.2	22.9	2,974	487
2.3	8.9	1,149	563

Female composition in the harvest was 46% (Table 10).

The General Subdistrict set gillnet sockeye salmon harvest of 14,299 which historically averaged 2.3% of the total UCI sockeye salmon harvest, represented 0.3% of the total UCI harvest in 2004 (Tables 3 and 11).

The major age class percentages, number of fish, and mean lengths from the General Subdistrict were:

<u>Age Class</u>	<u>%</u>	<u>Commercial Harvest</u>	<u>Mean Length (mm)</u>
1.2	12.0	1,719	514
1.3	66.8	9,548	580
2.2	3.5	498	517
2.3	15.2	2,172	584

Females represented 50% of the harvest (Table 11).

The Kalgin Island commercial set gillnet harvest of 61,716 sockeye salmon represented 1.3% of the total UCI sockeye salmon harvest (Table 2). Historically the Kalgin Island harvest represents 1.5% of the total sockeye salmon harvest. Since Kalgin Island harvests are mixed with General or Western Subdistrict harvests, before delivery to the processors, crews were unable to sample unmixed Kalgin Island Subdistrict sockeye salmon for age composition in 2004.

The Western Subdistrict set gillnet harvest of 68,481 represented 1.4% of the total UCI sockeye salmon harvest (Table 2 and 12). Historically, the Western Subdistrict harvests 1.5% of the total sockeye salmon harvest. The major age class percentages, numbers of fish, and mean lengths were:

<u>Age Class</u>	<u>%</u>	<u>Commercial Harvest</u>	<u>Mean Length (mm)</u>
1.2	14.3	9,778	489
1.3	38.3	26,249	560
2.2	22.4	15,342	498
2.3	24.3	16,664	566

Females represented 52% of the harvest (Table 12).

Escapement

It is estimated that a minimum of 2,562,106 sockeye salmon escaped the commercial fishery and entered the 5 major rivers and “other” streams of UCI (Table 3). Sockeye salmon escapements in descending order of abundance were 1,385,981 fish in Kenai River, 577,581 in Kasilof River, 334,188 in “other” systems, 138,998 in Susitna River, 103,201 in Crescent River and 22,157 in Fish Creek. The estimate of “other” streams is calculated as 15% of the escapements into the major river systems, based on earlier studies done to evaluate production from other systems in Upper Cook Inlet (Fox 1998). The estimate of total Susitna River escapement represents the combined escapement at Yentna River sonar site (71,281) plus an estimate of the mainstem Susitna River based on the historical relation of Yentna River (x) to Sunshine Station (y) from 1981-1985 (the only years of comparison) which yielded the following function (Westerman and Willette 2003):

$$y = 0.95 * x \quad (1)$$

The predominate age classes in the five monitored UCI sockeye salmon escapements were age 1.2 (19.8%), age 1.3 (53.0%), age 2.2 (15.1%) and age 2.3 (10.9%; Table 3). Individual age class compositions by river are presented in Figure 9.

Major age class percentages, number of fish, and mean lengths in the Kenai River weighted sockeye salmon escapement were:

<u>Age Class</u>	<u>%</u>	<u>Escapement</u>	<u>Mean Length (mm)</u>
1.2	10.1	140,229	489
1.3	69.1	957,687	576
2.2	8.2	114,139	512
2.3	11.1	154,360	581

The overall mean length of Kenai River sockeye salmon was 562 mm. Females comprised 55% of the Kenai River escapement (Tables 3 and 13). Table 14 presents Kenai River age composition data from three strata, 1-20 July, 21-30 July and 31 July-18 August. The age composition of overall dates combined is similar to the weighted age composition.

Hidden Creek, a tributary of the Kenai River, had a return of 18,172 sockeye salmon represented by age-1.2 (66.5%), age-1.3 (18.9%), age-2.2 (12.4%) and age-2.3 (2.1%) fish. Female composition in Hidden Creek was 46% (Table 15).

Russian River, another tributary of Kenai River, had a late run sockeye salmon weir escapement of 110,244. Major age class percentages, numbers of fish, and mean lengths in the Russian River sockeye salmon escapement were:

<u>Age Class</u>	<u>%</u>	<u>Escapement</u>	<u>Mean Length (mm)</u>
2.1	4.6	5,074	398
1.3	2.5	2,768	582
2.2	61.1	67,346	511
2.3	28.9	31,828	582

The overall mean length of Russian River sockeye salmon was 527 mm. Females comprised 54% of the sockeye salmon sampled (Table 16).

Kasilof River had an escapement of 577,581 sockeye salmon. Major age class percentages, number of fish, and mean lengths in the Kasilof River weighted sockeye salmon escapement were:

<u>Age Class</u>	<u>%</u>	<u>Escapement</u>	<u>Mean Length (mm)</u>
1.2	43.7	252,534	478
1.3	18.9	109,409	544
2.2	32.6	188,286	478
2.3	4.3	24,808	531

The overall mean length of Kasilof River escapement sockeye salmon was 493 mm. Females comprised 54% of the sockeye salmon sampled (Tables 3 and 17). Table 18 presents Kasilof River age composition data from three strata, 15 June-10 July, 11-20 July and 21 July-15 August. Overall dates combined is similar to the weighted age composition. Figure 10 shows the age class composition trends from the three strata taken on Kenai River and Kasilof River through the season.

Crescent River escapement was 103,201 sockeye salmon with the following major age class percentages, number of fish, and mean lengths:

<u>Age Class</u>	<u>%</u>	<u>Escapement</u>	<u>Mean Length (mm)</u>
1.2	14.1	14,562	467
1.3	31.3	32,290	554
2.2	16.0	16,461	481
2.3	38.0	39,255	556

The overall mean length of Crescent River escapement sockeye salmon was 531 mm. Females comprised 48% of the Crescent River escapement (Tables 3 and 19).

The Yentna River, a tributary of the Susitna River, had an escapement of 71,281 sockeye salmon. The major age class percentage, number of fish, and mean lengths were:

<u>Age Class</u>	<u>%</u>	<u>Escapement</u>	<u>Mean Length (mm)</u>
1.2	17.0	12,087	474
1.3	50.0	35,640	562
2.2	8.3	5,888	478
2.3	21.7	15,496	562

The overall mean length of Yentna River sockeye was 538 mm. Female composition in the escapement was 52% (Tables 3 and 20).

Fish Creek had an escapement of 22,157 sockeye salmon. Fish Creek sockeye salmon age class percentages, number of fish, and mean lengths were:

<u>Age Class</u>	<u>%</u>	<u>Escapement</u>	<u>Mean Length (mm)</u>
1.1	2.7	600	364
1.2	41.8	9,258	472
1.3	41.6	9,214	538
2.2	2.5	557	484
2.3	9.1	2,014	538

The overall mean length of Fish Creek sockeye salmon was 503 mm. Females comprised 52% of the escapement (Tables 3 and 21).

Offshore Test Fish

Age class percentages, number of fish, and mean lengths from sockeye salmon caught on the offshore test fish boat in 2004 were:

<u>Age Class</u>	<u>%</u>	<u>Number of Fish</u>	<u>Mean Length (mm)</u>
1.2	8.0	226	500
1.3	72.8	2,057	572
2.2	6.1	173	501
2.3	11.4	321	566

Age composition was similar to the Central District drift fishery results. Overall female composition from the drift fishery (56%) was higher than samples from the offshore test fish boat (48%). The mean length of all age classes from the Central drift fishery was 576 mm, while the mean length from the offshore test fish sample was 561 mm (Table 22).

CHINOOK SALMON

Commercial Harvest

The total commercial harvest of Chinook salmon in 2004 was 27,286 which was above the long-term average harvest (1974-2003) of 16,841 fish. The Upper Subdistrict set gillnet fishery harvest was 21,656 or 79% of the UCI harvest (Table 2).

The predominant age class percentages, number of fish, and mean lengths in the Upper Subdistrict Chinook harvest were:

<u>Age Class</u>	<u>%</u>	<u>Commercial Harvest</u>	<u>Mean Length (mm)</u>
1.1	3.5	766	428
1.2	19.8	4,294	645
1.3	48.2	10,442	866
1.4	27.6	5,985	1,010

The overall mean length was 848 mm, and females accounted for 44% of the commercial harvest (Table 23).

COHO SALMON

Commercial Harvest

The coho salmon commercial harvest of 309,001 fish was 50,000 below the long term average, but was the largest harvest since 1996. Coho salmon were sampled from three gillnet fisheries which represented 84% of the total UCI coho salmon harvest (Table 24). Age-2.1 coho salmon accounted for the bulk of the harvest:

	<u>Age 2.1</u>	<u>Harvest</u>	<u>Mean Length (mm)</u>
Central District drift gillnet	76.8%	152,410	573
Upper Subdistrict set gillnet	75.8%	22,855	571
General Subdistrict set gillnet	78.8%	25,505	554

Age 1.1 (11.7%) and age-3.1 (11.4%) accounted for the remainder of the total monitored coho salmon harvests. Mean lengths for all three age groups combined were, on average, larger in the Central District drift harvests (572 mm) and in the Upper Subdistrict set gillnet harvest (572 mm) than in the General Subdistrict (553 mm; Tables 24-27). Female composition ranged from 44% in the Upper Subdistrict set gillnet harvest to 52% in the Central District drift harvest.

CHUM SALMON

Commercial Harvest

The total chum salmon commercial harvest was 145,129 fish. The historic average harvest of chum salmon is 492,407. Chum salmon were sampled from the commercial drift gillnet harvest of 136,006 fish, which made up 94% of the total commercial harvest (Table 28). The major age class percentages, number of fish, and mean lengths were:

<u>Age Class</u>	<u>%</u>	<u>Commercial Harvest</u>	<u>Mean Length</u>
0.3	52.3	71,159	589
0.4	46.0	62,617	604

Females represented 51% of the chum salmon harvest. Overall mean length was 595 mm (Table 28).

TABLES AND FIGURES

Table 1.—Number of salmon sampled from selected commercial gillnet harvests, escapements, and offshore test fishing in Upper Cook Inlet, Alaska, 2004.

Location ^a	Species			
	Chinook	Sockeye	Coho	Chum
Commercial Harvest				
Central District				
Drift		5,010	500	1,000
Upper Subdistrict ^b	1,707		644	
Cohoe/Ninilchik Beach		3,937		
North Kalifornsky Beach		4,000		
South Kalifornsky Beach		4,430		
Salamatof Beach		2,892		
Western Subdistrict		960		
Kalgin Island		0		
Northern District				
Eastern Subdistrict		500		
General Subdistrict		349	500	
Subtotal	1,707	22,078	1,644	1,000
Escapement				
Central District				
Kenai River - late run				
Mainstream		1,833		
Hidden Creek ^c		241		
Russian River		246		
Kasilof River				
Mainstream		1,806		
Crescent River		563		
Northern District				
Susitna River				
Yentna River		534		
Fish Creek ^d		609		
Subtotal	0	5,832	0	0
Offshore Test Fish boat				
Drift - Anchor Point to Red River Delta ^e		1,601		
Total Samples	1,707	29,511	1,644	1,000

Note: Areas with no harvest indicate areas that were not sampled.

^a Specific locations not footnoted were sampled by Commercial Fisheries personnel, (ADF&G)

^b Represents pooled samples from the Upper Subdistrict commercial set gillnet fisheries.

^c Samples collected by Cook Inlet Aquaculture Association (CIAA).

^d Samples collected by Sport Fish Division personnel, ADF&G.

^e Samples collected by Offshore Test Fish crew.

Table 2.—Number of salmon commercially harvested and sockeye escapements into the five major river systems of Upper Cook Inlet, Alaska, 2004.

Fishery	Code	Chinook	Sockeye	Coho	Pink	Chum	Total
Northern District Total		2,058	27,286	44,130	2,017	2,148	77,639
