

# Estimating the Kenai brown bear population on Kenai National Wildlife Refuge and Chugach National Forest in 2010

John Morton

# Principal investigators

**Dr. John Morton (Kenai NWR)**

**Marty Bray (Chugach National Forest)**

**Dr. Greg Hayward (USFS Alaska Region)**

**Dr. Gary White (Colorado State University)**

**Dr. Dave Paetkau (Wildlife Genetics International)**

# Why we were (and are) concerned about the Kenai brown bear population....

- ✓ Kenai brown bears designated a *Population of Special Concern* by State of Alaska in 1998
- ✓ DNA analysis confirmed Kenai brown bear population is genetically less diverse than mainland Alaskan brown bears and not panmictic with Anchorage brown bear population (Talbot & Farley 2009)
- ✓ Only estimate of 250-300 brown bears based on multiplying the area of suitable habitat (13,848 km<sup>2</sup>) by mean bear density (20 bears per 1000 km<sup>2</sup>) from other AK studies
- ✓ Based on 1995-1999 data (IBBST 2001), not clear if population was stable, declining or increasing ( $\lambda = 0.9364 - 1.0588$ )
- ✓ Low estimates of yearling survivorship and small proportion of subadult (2-6 year olds) females in age distribution suggested low recruitment (IBBST 2001)

# ***DNA-based mark-recapture estimate of Kenai brown bear population***

**Objective: to estimate the brown bear  
population on the Kenai Peninsula  $\pm 25\%$   
of the true population (N)**

# Simple Lincoln-Petersen Estimator

$$R/M = C/N$$

$N$  = Estimate of total population size

$M$  = Total number of animals captured and marked on the first visit

$C$  = Total number of animals captured on the second visit

$R$  = Number of animals captured on the first visit that were then recaptured on the second visit

# Simple Lincoln-Petersen Estimator

$$N = MC/R$$

$N$  = Estimate of total population size

$M$  = Total number of animals captured and marked on the first visit

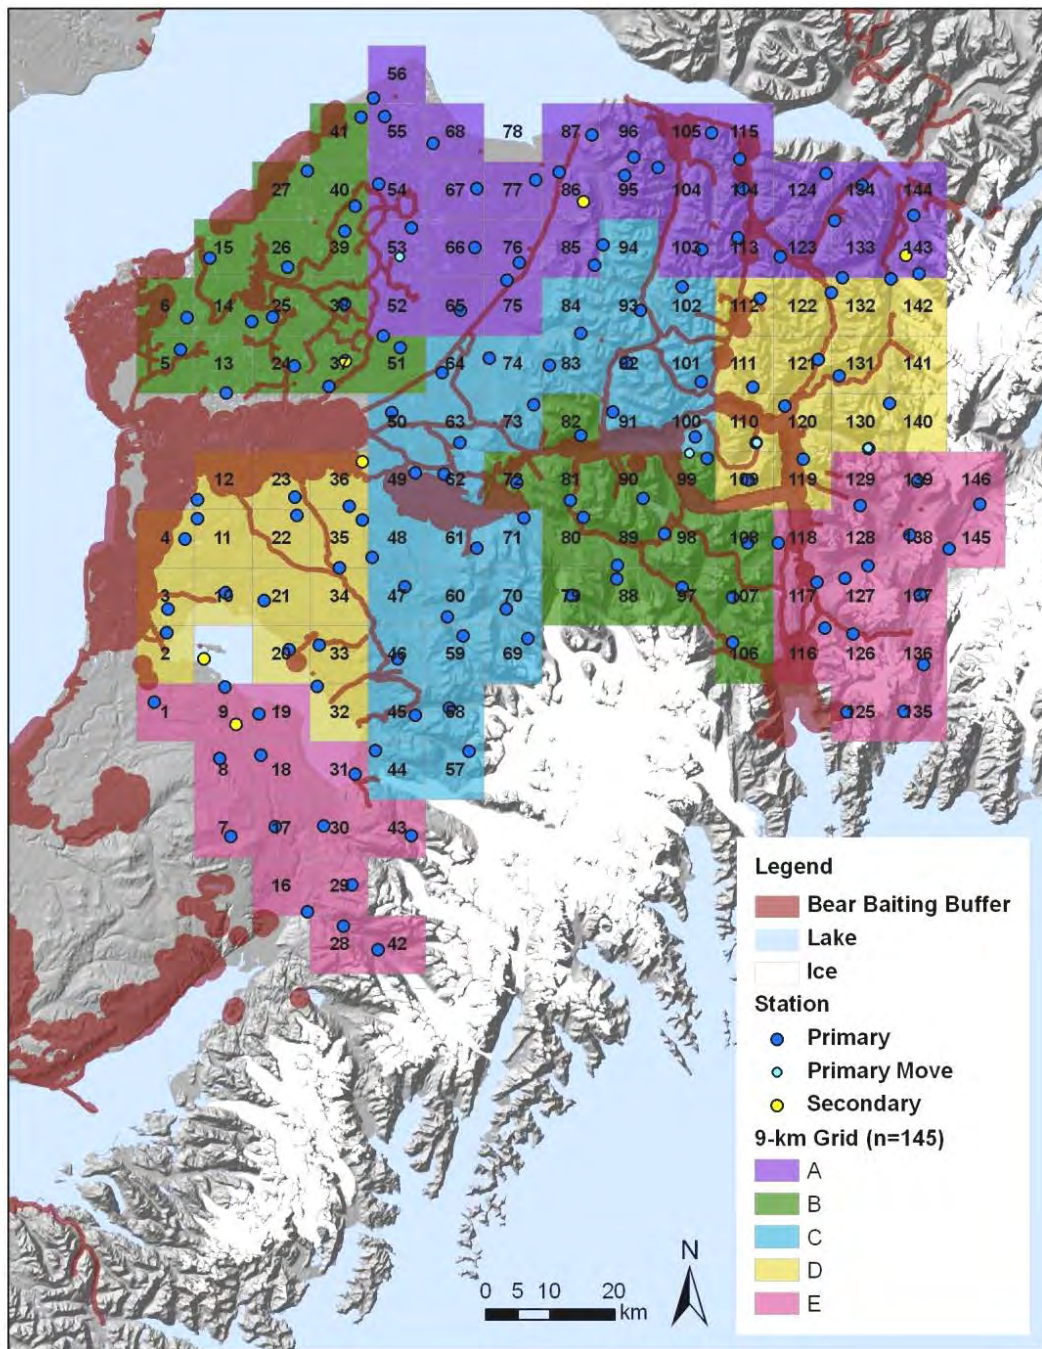

$C$  = Total number of animals captured on the second visit

$R$  = Number of animals captured on the first visit that were then recaptured on the second visit

...the key is that the estimate is not based on the number of individuals marked (i.e., genotypes) but on their recapture rates

# Assumptions of Mark-Recapture Model

- ✓ No individuals die, are born, move into the study area (immigrate) or move out of the study area (emigrate) between visits
- ✓ No marks fall off animals between visits, and that the researcher correctly records all marks
- ✓ Equal capture probability of individuals

**145 primary hair stations  
subjectively placed within 81-  
km<sup>2</sup> cells systematically  
distributed over 11,500 km<sup>2</sup>  
study area**

**29 stations sampled daily over  
five 5-day trap sessions using  
rotating panel design**

## *Selection criteria for hair stations*

- ✓ adequate space for helicopter access
- ✓ >200m from trails, cabins, roads
- ✓ riparian/wetland corridors
- ✓ other travel corridors (ridges, shoulders, chutes)
- ✓ OTBE, ensure good spatial separation among sites within a cell

# ***ADF&G black bear baiting restrictions***

**no baiting within 1 mile of any residence, including seasonally occupied dwellings, developed recreational facilities or campgrounds;**

**no baiting within 1/4 mile of any publicly-maintained road, trail, or the Alaska Railroad;**

**no baiting within 1/4 mile from the shoreline of the Kenai, Kasilof and Swanson Rivers (including Kenai and Skilak Lakes).**

**Four sets of 2-person field crews operated out of Moose Pass and Soldotna for 31 consecutive days**

Hair station: \_\_\_\_\_ Barb # \_\_\_\_\_ Session # \_\_\_\_\_

Date: June \_\_\_\_, 2010

3 hairs or less? Y / N

Hair Location: Upper strand / Lower strand

Probable species: Brown bear / Black bear / unknown

Comments: \_\_\_\_\_

106624

106624

11,175 hair samples (grid) + 91 hair samples (rub tree)

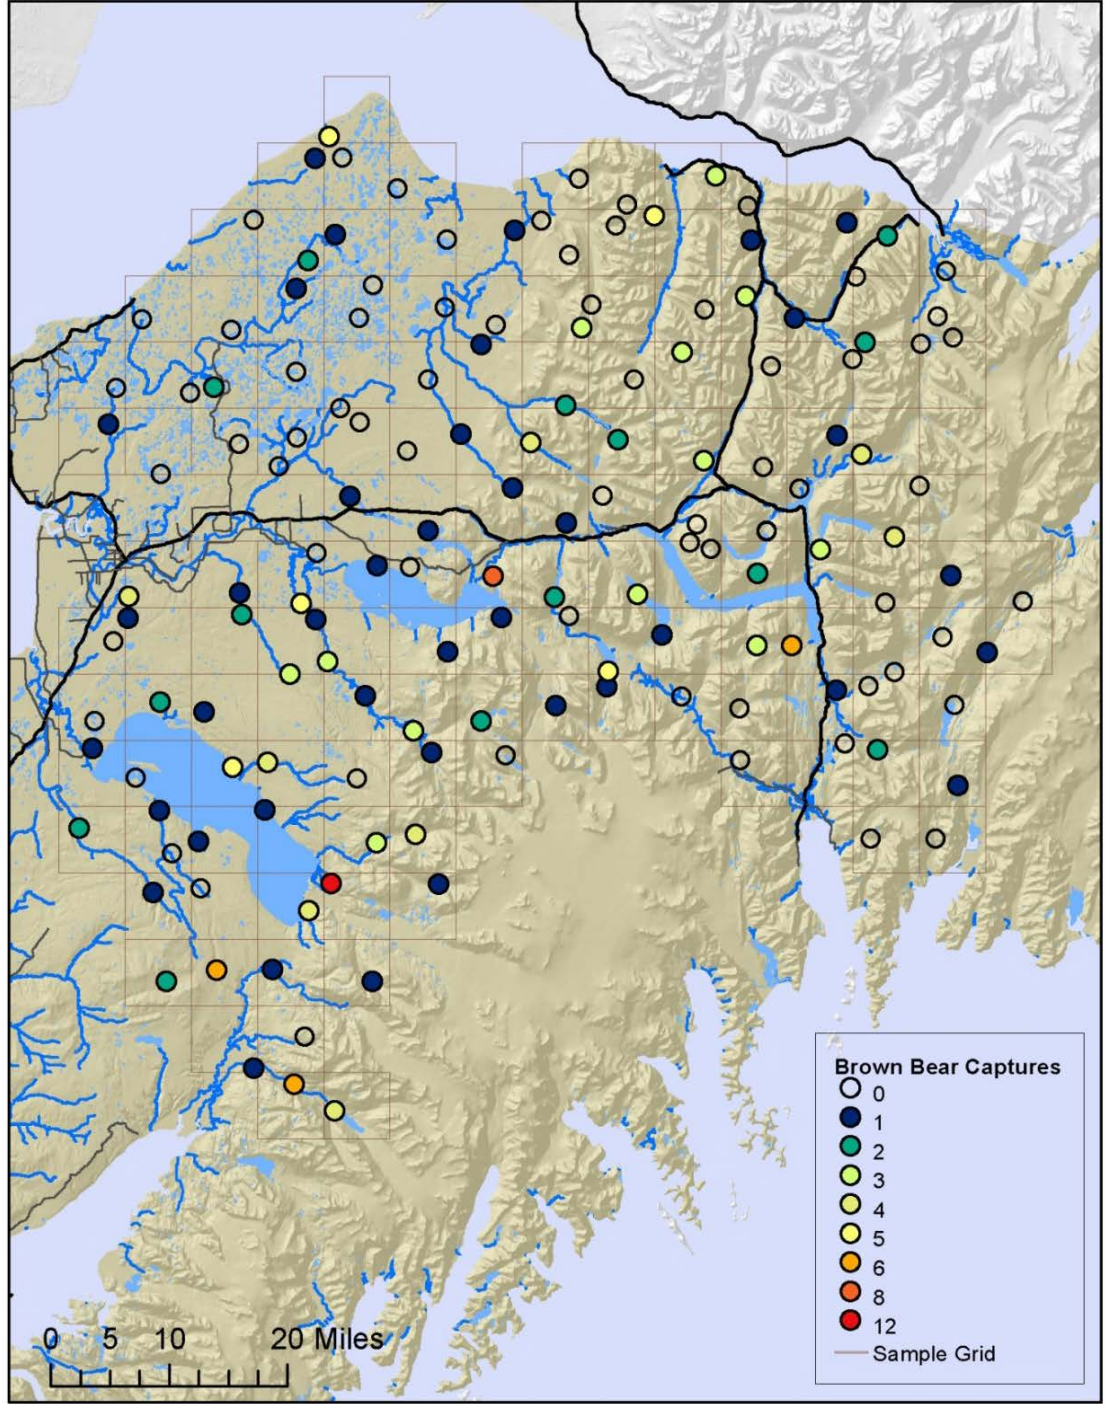

11,266 hair samples

2,671 DNA samples

1,034 brown bear samples

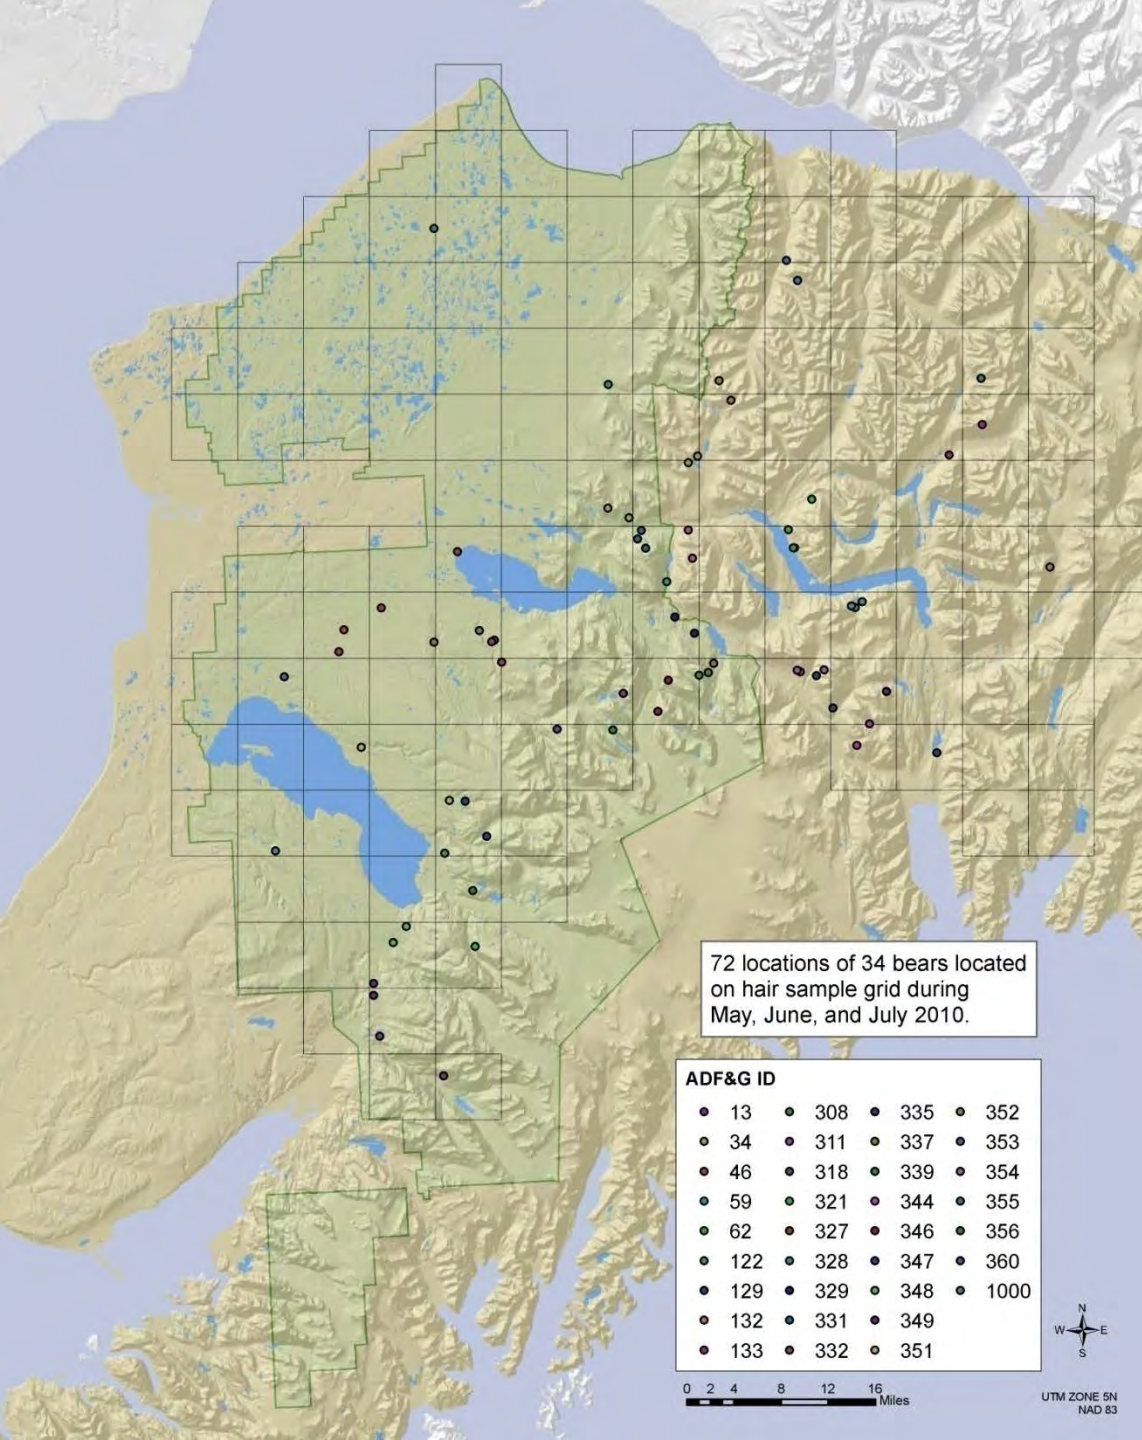

211 unique genotypes

104 males + 99 females (n = 203)

**Distribution of 211 brown bear captures at 145 primary + 7 secondary hair stations**

**Of 39 females collared by ADF&G, 34 were on study area**

## Capture rates were relatively low

Sex	Occasion	Estimate	SE	95% Lognormal CI	
				LCI	UCI
Female	1	<b>0.0376</b>	0.0106	0.0215	0.0650
	2	<b>0.0902</b>	0.0198	0.0581	0.1372
	3	<b>0.0783</b>	0.0179	0.0497	0.1213
	4	<b>0.1061</b>	0.0224	0.0696	0.1585
	5	<b>0.1101</b>	0.0230	0.0724	0.1639
Male	1	<b>0.0595</b>	0.0156	0.0353	0.0986
	2	<b>0.1381</b>	0.0272	0.0928	0.2005
	3	<b>0.1208</b>	0.0249	0.0799	0.1785
	4	<b>0.1610</b>	0.0302	0.1101	0.2294
	5	<b>0.1667</b>	0.0310	0.1144	0.2365

# Brown bear population estimate (all ages) on 11,700 km<sup>2</sup> sample frame

## GRID ONLY

Sex	Estimate	SE	$M(t + 1)$	95% Lognormal CI	
				LCI	UCI
Females	114.2	17.1	65	90.4	160.4
Males	194.1	26.4	101	155.0	261.5
<b>Combined</b>	<b>308.3</b>	<b>31.8</b>	<b>166</b>	<b>258.3</b>	<b>385.4</b>

# How did we improve our estimate when capture rates were low?

- ✓ We adjusted capture probability using elevation, distance to edge, and sex as covariates
- ✓ We added a 6<sup>th</sup> trap occasion with bears known to be alive and on the study area (telemetered bears, rub trees)
- ✓ We used model-averaged estimates to ensure robustness

# Brown bear population estimate (all ages) on 11,700 km<sup>2</sup> sample frame

## GRID + telemetry data + rub trees

Sex	Estimate	SE	$M(t + 1)$	95% Lognormal CI	
				LCI	UCI
Females	214.6	33.7	99	165.0	301.3
Males	213.1	30.9	104	167.2	292.2
<b>Combined</b>	<b>427.6</b>	<b>46.7</b>	<b>203</b>	<b>353.2</b>	<b>539.1</b>

**428 (353-539) brown bears population estimate  
(all ages) on 11,700 km<sup>2</sup> sample frame**

**or 9,500 km<sup>2</sup> available habitat**

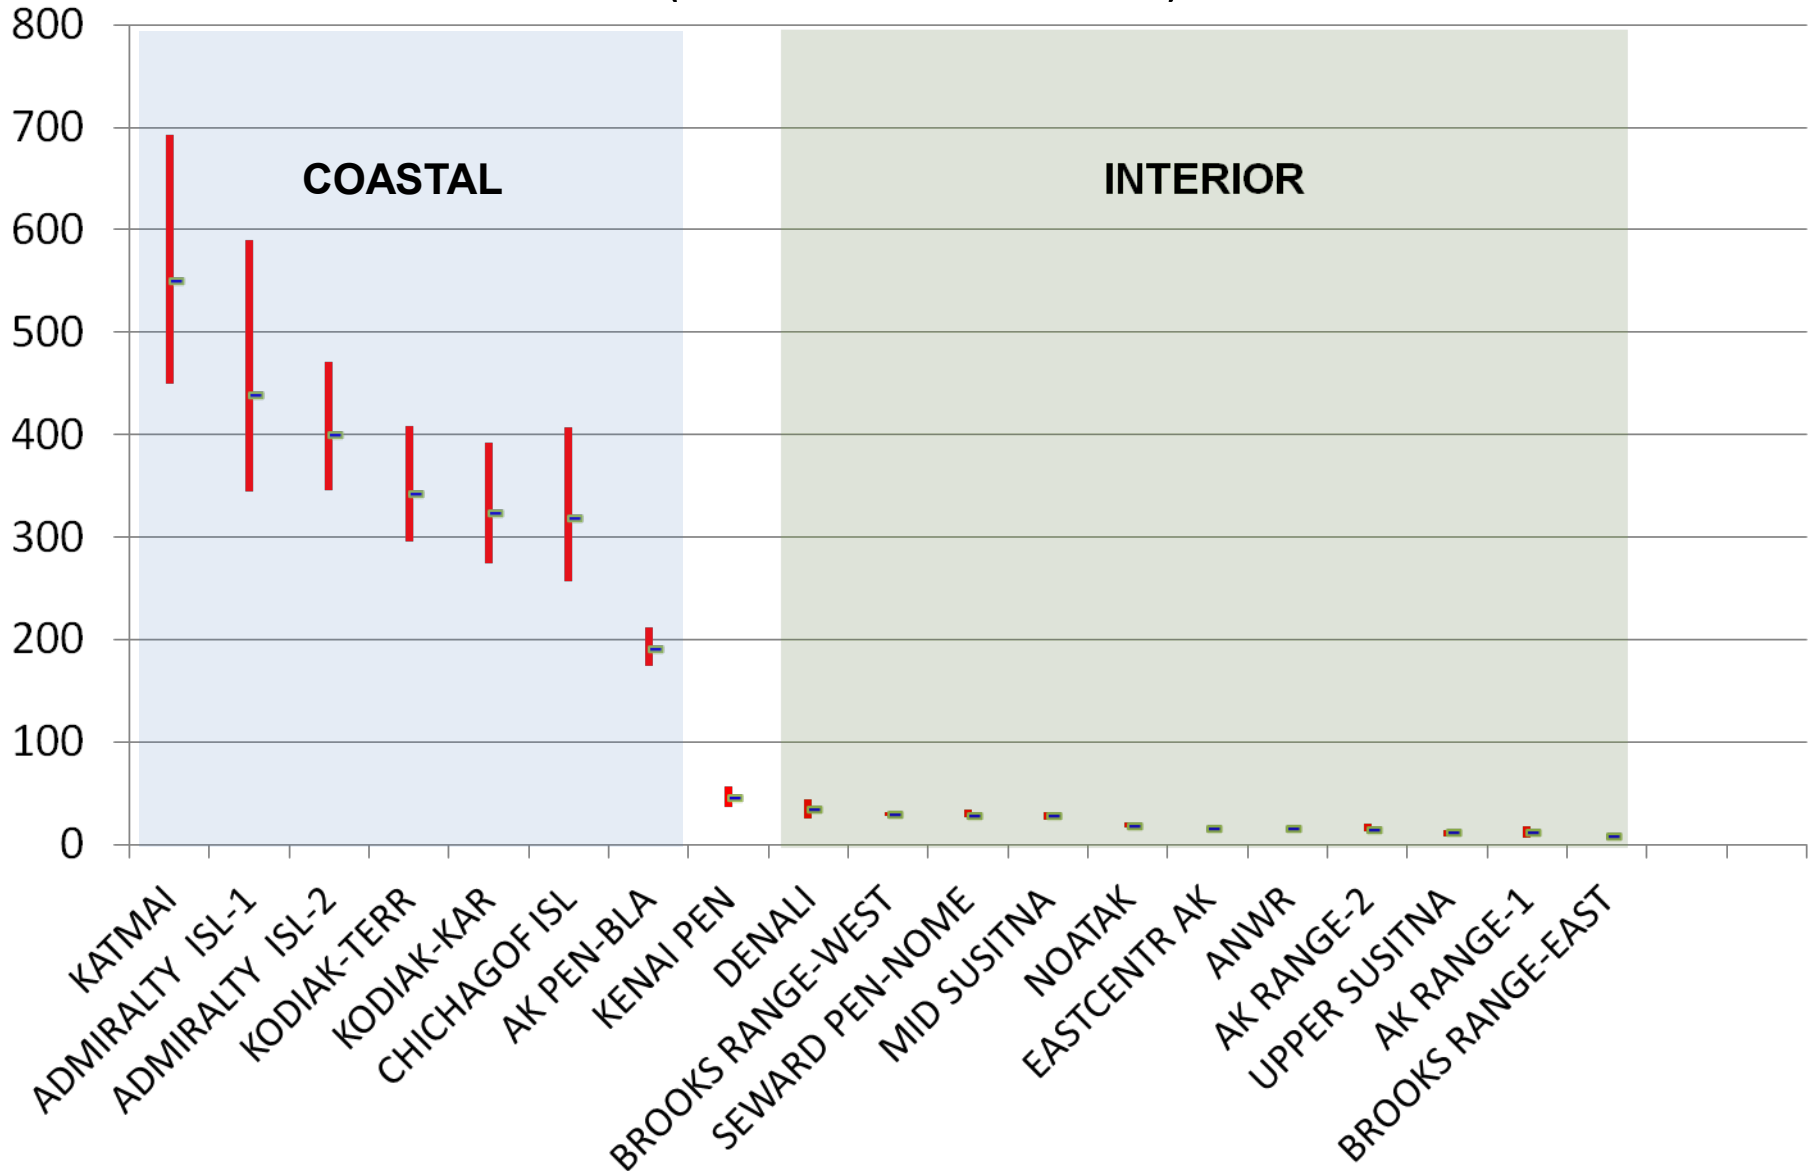

**≈ 45.1 bears per 1,000 km<sup>2</sup>**

**≈ 624 bears on the KP (504-772)**

**≈ 200 reproductive age females**

# ALASKA BROWN BEAR DENSITIES (PER 1000 KM<sup>2</sup>)

(after Miller et al. 1997)

How representative of the  
Kenai Peninsula is this density  
estimate?

Landcover types	Study area	Kenai Peninsula
	1,174,500 ha	2,433,777 ha
Alpine	16.7%	11.9%
Mixed forest	13.8%	9.6%
Black spruce	11.2%	6.2%
Alder	10.3%	9.8%
White/Lutz/Sitka spruce	8.9%	9.7%
<b>Snow/Ice</b>	<b>6.5%</b>	<b>20.1%</b>
Barren/Rock	6.3%	5.2%
Lake	5.9%	4.0%
Wetland – graminoid	3.6%	3.6%
Mountain hemlock	3.3%	2.5%
Mixed conifer	2.4%	3.8%
Paper birch	2.3%	1.7%
Sparsely vegetated	1.6%	1.8%
Willow	1.2%	1.7%
Barren – wet	1.0%	2.1%
Herbaceous	0.8%	0.9%
Stream	0.8%	0.7%
Wetland - shrub	0.7%	1.0%
Other shrub	0.6%	0.7%
Mixed deciduous	0.5%	0.4%
Alder/Willow	0.4%	0.5%
Black cottonwood (balsam poplar)	0.4%	0.3%
Urban/Cultural	0.3%	0.6%
Aspen	0.2%	0.2%
Wetland - halophytic	0.2%	0.9%
Estuarine	0.0%	0.1%

**Distribution of dens from 74 brown bear sows during (1996-2003)**

**► 84% denned on study area**

# What are the management implications for Kenai brown bears?

- ✓ Represents baseline estimate of the Kenai brown bear population
- ✓ Puts human-caused mortality (legal harvest, illegal take, vehicle collisions and DLPs) into better context
- ✓ Helps determine sustainable harvest of reproductive-age females
