ACKNOWLEDGMENTS

The ADF&G Division of Habitat thanks the Alaska Sustainable Salmon Fund for the financial support of this Anadromous Waters Catalog project—specifically, Cecelia Curtis and Deborah Maas.

We thank the staff of the Divisions of Habitat, Sport Fish, and Commercial Fisheries for assisting with fieldwork, including Paul Blanche, Jim Bales, Josh Brekken, Jesse Coleman, Jeanette Alas, Jodi Estrada, Dillon Shults, Ryan Snow, Lisa Fox, Raye Anne Neustel, and Sean Mills.

We thank A-1 Timber Consultants, Afognak Native Corporation, and Koncor Forest Products for their financial and logistical support for the 2012 and 2013 sampling effort. We specifically acknowledge the assistance provided by David Nesheim, Greg Harris, and Keith Coulter.

Finally, I would like to thank Michael J. Daigneault for his guidance and patience during the writing of this document.

The use of product, software, and company names throughout this report is not an Alaska Department of Fish and Game recommendation or implied endorsement. The Alaska Department of Fish and Game, in accordance with State of Alaska ethics laws, does not favor one group over another through endorsement or recommendation.

EXECUTIVE SUMMARY

In summer 2012 and 2013, the Alaska Department of Fish and Game (ADF&G), Division of Habitat, sampled for the presence of anadromous fish on Afognak and Kodiak Islands on land owned by Afognak Native Corporation, Natives of Kodiak Incorporated, Ouzinkie Native Corporation, and Leisnoi Incorporated. The information gathered was used to submit official nominations for inclusion in the ADF&G *Catalog of Waters Important for the Spawning, Rearing, or Migration of Anadromous Fishes* and its companion Atlas (AWC).

Inclusion in the AWC will help to conserve salmon habitat by providing the 66-foot riparian retention area protection required under the Alaska Forest Resources and Practices Act. A water body listed in the AWC is also afforded protection under Alaska Statute 16.05.871.

Water bodies were sampled using a backpack electrofisher or baited minnow traps. Adult salmonids observed were counted and their spawning activity noted.

Sampling was terminated at barriers to fish passage when such barriers were present. Absent a barrier, the sampling team determined the most appropriate location to terminate sampling based on an assessment of available habitat, stream gradient, and a failure to capture fish at a given sampling location.

On Afognak Island, 11 watersheds were sampled during the 2012 season and 16 watersheds were sampled during the 2013 season. On Kodiak Island, 5 watersheds were sampled during the 2012 season and 7 watersheds were sampled during the 2013 season. Fish presence sampling resulted in 99 nominations to the AWC in 2012 and 59 nominations to the AWC in 2013, with 52.4 km of stream added to the AWC.

During the 2012 and 2013 sampling effort on Afognak and Kodiak Islands, 17 specified water bodies were found to support additional life stages of anadromous fish. During the 2012 and 2013 sampling effort, 17 specified streams on Afognak Island were determined by GPS to be mapped in the wrong location, and in 2013, three new anadromous fish watersheds were identified on Afognak Island. The new watersheds are located in Kazakof Bay, Saposa Bay, and Izhut Bay.

Adult and juvenile coho salmon (*Oncorhynchus kisutch*) and Dolly Varden (*Salvelinus malma*) were the most common salmonid species captured or observed in 2012 and 2013. Other adult and juvenile salmonid species captured or observed were pink salmon (*O. gorbuscha*) and rainbow/steelhead trout (*O. mykiss*). Additional species captured or observed were threespine stickleback (*Gasterosteus aculeatus*), ninespine stickleback (*Pungitius pungitius*), and sculpin (*Cottus* spp).

INTRODUCTION

The mission of the Alaska Department of Fish and Game (ADF&G) is to protect, maintain, and improve the fish, game, and aquatic plant resources of the state, and manage their use and development in the best interest of the economy and the well-being of the people of the state, consistent with the sustained yield principal. The mission of ADF&G Division of Habitat is to protect Alaska's valuable fish and wildlife resources and their habitats as Alaska's population and economy continue to expand.

In the fall of 2011, a 3-year grant was secured through the Alaska Sustainable Salmon Fund (AKSSF) for ADF&G to sample streams and lakes on Afognak and Kodiak Islands and document the presence of anadromous fish in advance of timber harvest activity. Afognak and Kodiak Islands are located about 390 km southwest of Anchorage, Alaska (Figure 1). The information gathered will be used to submit official nominations for inclusion in the *Catalog of Waters Important for the Spawning, Rearing, or Migration of Anadromous Fishes* and its companion Atlas (AWC). Inclusion in the AWC will conserve salmon habitat by providing the 66-foot riparian retention area required under the Alaska Forest Resources and Practices Act (FRPA), at 11 Alaska Administrative Code (AAC) 95.260. A specified water body listed in the AWC is also afforded protection under State law at Alaska Statute (AS) 16.05.871.

Figure 1.–Afognak and Kodiak Islands.

ADF&G initiated this project to document anadromous fish presence prior to timber harvest occurring on Afognak and Kodiak Islands. The department coordinated with three land managers in the region: Afognak Native Corporation, Koncor Forest Products, and Leisnoi Incorporated. The coordination included a review of upcoming timber harvest activities, prioritization of areas to be sampled, and field sampling logistics.

METHODS

ADF&G developed maps using Geographic Information Services (GIS) mapping software to assist with locating streams in the project area. The maps were produced by using georeferenced satellite imagery with the AWC data layer. Most streams sampled on Afognak and Kodiak Islands in 2012 and 2013 were small (< 8m wide) first-, second-, and third-order tributaries of known anadromous streams (Strahler 1957). Sampling was prioritized by cross-referencing the upcoming timber harvest activities with those water bodies likely to support anadromous fish. The length of each reach sampled was measured using the GIS measuring tool.

Water bodies were sampled by a team of two ADF&G staff. Sampling was conducted using a Smith-Root LR-25 backpack electrofisher. Output voltage was adjusted to the minimum level necessary to achieve taxis (forced swimming), and continuous DC was used to minimize fish injury (NMFS 2000). A single electrofishing pass at each sample reach was completed, starting at the downstream end and working upstream.

Lakes and ponds were sampled using Gee-type minnow traps baited with betadine-treated salmon eggs. Traps soaked for a minimum of two hours. Trap size selected for smaller fish, but this outcome was considered adequate as an indicator of the presence of fish species (Bloom 1976). However, it is noted that juvenile sockeye may be missed by minnow trapping,

potentially causing underestimation of sockeye distribution because of this species' tendency toward a planktivorous diet (Burgner 1991).

Captured juvenile salmon and Dolly Varden were identified to species and counted. Because of time constraints, a select number were measured to the nearest mm in fork length (FL). Stickleback and sculpin were noted as present but not measured or counted. All fish were released into a slack-water area at the point of capture. Adult salmonids observed were counted, and spawning activity was noted.

We used existing FRPA criteria (Table 1) and professional judgment to determine the upper extent of the water body to be sampled. Absent a barrier, the sampling team determined the most appropriate location to terminate sampling, based on an assessment of available habitat, stream gradient, and a failure to capture fish at a given sampling location.

Table 1.—Anadromous Fish Blockage (11 AAC 95.265(g) Table A).

Criterion	Species Requirements (in feet)				
	Coho	Steelhead	Sockeye	Chinook	Pink/Chum
Maximum fall height: A blockage may be presumed if fall height in feet exceeds:	11	13	10	11	a) 4 with deep jump pool b) 3 without pool
Pool depth: A blockage may be presumed if the unobstructed water column depth in feet within the pool is less than:	1.25 x jump height, except that no minimum pool depth exists for falls as follows: a) less than 4 in the case of coho and steelhead; and b) less than 2 in the case of other anadromous fish species.				
Steep channel: A blockage may be presumed at the upper end of the reach if channel steepness in feet is equal to or greater than the following without resting places for fish:	<ul style="list-style-type: none"> • 225 at 12% gradient • 100 at 16% gradient • 50 at 20% gradient • 25 at 24% gradient 			100 at 9% gradient	

A hand-held Garmin GPS unit was used to record the geographic information to verify or correct the actual location of water bodies or add barriers to fish passage. Number and length of fish captured or observed were recorded with the GPS device to allow for georeferencing. These data were used to submit nominations to the AWC. Nominations included new water bodies, upstream extensions of existing anadromous waters, addition of species or life stages, and corrections of water body location. Nominations were completed according to the ADF&G submission guidelines and requirements (ADF&G 2014).

RESULTS

In 2012, 7 sampling events occurred monthly on Kodiak Island from April through October and 6 sampling events occurred on Afognak Island from May through October. In 2013, sampling events occurred each month on Kodiak and Afognak Islands from April through October.

On Afognak Island, 11 watersheds were sampled during the 2012 season. A total of 51 reaches were sampled with a total length of 24.3 km. The total length that was documented as containing anadromous fish and added to the AWC was 16.2 km (Table 2 and Appendices A1–A12). A beach berm (on Stream No. 252-32-10004) was determined to be a barrier to fish passage, and the specified reach was reduced by 225 m.

Table 2.–Afognak Island watersheds sampled in 2012.

Watershed Name	AWC Number	# Reaches Sampled	Total Length Sampled (meters)	Total New AWC Length (meters)
Cascade Creek	252-33-10014	4	3,575	1,960
Cold Creek	252-33-10010	6	4,650	4,560
Little Afognak Lake	252-32-10010-0020	4	1,831	1,320
Marka River	252-34-10005	1	1,970	1,210

Unnamed (Duck Bay)	252-32-10004	1	955	60*
Unnamed (Izhut Bay)	252-31-10020	4	1,810	1,109
Unnamed (Mary Anderson Bay)	252-32-10008	2	665	550
Total		51	24,273	16,201

* Stream no. 252-32-10004 was revised because of a beach berm blocking fish passage.

On Afognak Island, 16 watersheds were sampled during the 2013 season. A total of 47 reaches were sampled with a total length of 23.6 km. The total length that was documented as containing anadromous fish and added to the AWC was 15.3 km (Table 3; Appendices A1–A12).

Table 3.–Afognak Island watersheds sampled in 2013.

Watershed Name	AWC Number	# Reaches Sampled	Total Length Sampled (meters)	Total New AWC Length (meters)
Cold Creek	252-33-10010	2	1,580	1,270
Little Afognak River	252-32-10010	7	3,118	2,650
Paramanof River	251-40-10030	7	2,200	840

Unnamed (Saposa Bay)	252-31-10010	1	220	220
Total		47	23,611	15,326

On Kodiak Island, 5 watersheds were sampled during the 2012 season. A total of 34 reaches were sampled with a total length of 17.3 km. The total length that was documented as containing anadromous fish and added to the AWC was 8.2 km (Table 4; Appendices A13–A16).

Table 4.–Kodiak Island watersheds sampled in 2012.

Watershed Name	AWC Number	# Reaches Sampled	Total Length Sampled (meters)	Total New AWC Length (meters)
Capelin Creek	259-25-10030	5	6,800	2,250
Chiniak River	259-25-10040	9	4,580	3,815
East Fork Twin Creek	259-25-10020-2001-3002	10	3,280	1,100
West Fork Twin Creek	259-25-10020	9	2,100	930
Sequel Pt. Creek	259-30-10004	1	500	117
Total		34	17,260	8,212

On Kodiak Island, 7 watersheds were sampled during the 2013 season. A total of 47 reaches were sampled with a total length of 17.5 km. The total length that was documented as containing anadromous fish and nominated to the AWC was 12.7 km (Table 5; Appendices A13–A16).

Table 5.–Kodiak Island watersheds sampled in 2013.

Watershed Name	AWC Number	# Reaches Sampled	Total Length Sampled (meters)	Total New AWC Length (meters)
Capelin Creek	259-25-10030	6	817	630
Chiniak River	259-25-10040	3	4,320	3,825
East Fork Twin Creek	259-25-10020-2001-3002	8	1,640	325

Sawmill Lake		2	370	0
Sequel Pt. Creek	259-30-10004	2	505	505
Total		47	17,477	12,653

During the 2012 and 2013 sampling effort, 17 known anadromous streams on Afognak Island were determined by GPS to be mapped in the wrong location. The stream mapping has been revised and corrections were submitted to the AWC (Table 6).

Table 6.—Anadromous streams on Afognak Island corrected in 2012 and 2013.

Streams Corrected 2012	Streams Corrected 2013
252-32-10004	251-40-10030-2008

	252-32-10040-2012
	251-82-10050-2033
	251-82-10060

During the 2013 sampling effort, 3 new watersheds were located on Afognak Island and nominated to the AWC. These 3 watersheds are located in Kazakof Bay, Sapos Bay, and Izhut Bay (Appendices A3, A8, and A9).

In 2012, there were 99 nominations submitted to the AWC, and 59 nominations were submitted in 2013. All of the nominations were accepted for inclusion into the AWC. Juvenile and adult coho salmon (*Oncorhynchus kisutch*) and Dolly Varden (*Salvelinus malma*) were the most common salmonid species captured or observed in 2012 and 2013. Other adult and juvenile salmonid species captured or observed were pink salmon (*O. gorbuscha*) and rainbow/steelhead trout (*O. mykiss*). Additional species captured or observed were threespine stickleback (*Gasterosteus aculeatus*), ninespine stickleback (*Pungitius pungitius*), and sculpin (*Cottus* spp).

During the 2012 and 2013 sampling effort on Afognak and Kodiak Islands, 17 known anadromous water bodies were found to support additional species or life stages (Table 7). The streams were updated in the AWC.

Table 7.—Additional species or life stages located on Afognak and Kodiak Islands.

Afognak Stream No.	Species Added	Life Stage Added
252-33-10010-2006-3007	Coho Salmon	Rearing

DISCUSSION

Sampling conducted in 2012 and 2013 on Afognak and Kodiak Islands identified new anadromous water bodies, extended existing anadromous waters, added species or life stages to existing anadromous waters, and corrected existing anadromous water-body locations. Nominations were completed according to ADF&G submission guidelines and requirements. All nominations submitted in 2012 have been included in the AWC 2013 revision. All nominations submitted in 2013 have been accepted, approved, and scheduled for inclusion in the 2014 AWC revision. Sampling will continue on Kodiak and Afognak Islands in the summer of 2014.

Inclusion in the AWC affords the water body protection under AS 16.05.871 by requiring ADF&G notification and approval for proposed activities below ordinary high water, in order to provide proper protection of fish and game. This project resulted in the addition of 52.4 km of stream habitat to the AWC.

Inclusion in the AWC results in a 66-foot riparian retention area under 11 AAC 95.260. Streams that were sampled on Kodiak Island and Afognak Island in 2012 and 2013 that did not result in the capture or observation of anadromous fish but flowed into a specified water body were voluntarily given a 66-foot riparian retention area by the landowner up to the point where a physical blockage was determined by FRPA criteria.

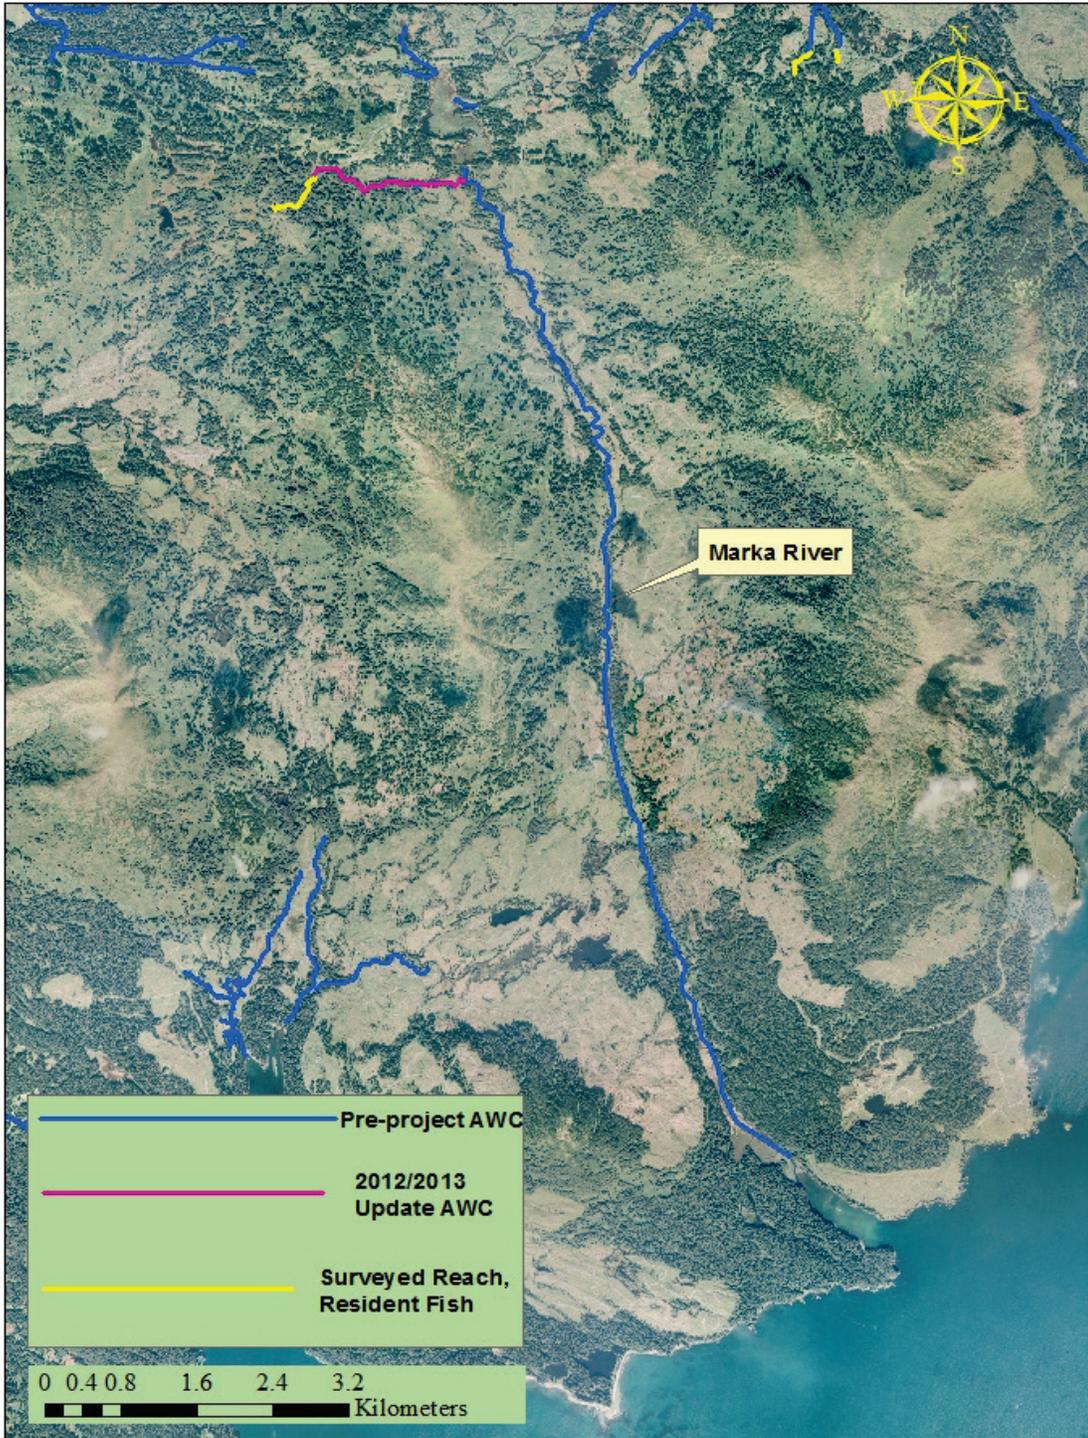

Riparian habitat provides streambank stability, filters pollutants, and maintains water quality for fish and wildlife habitat. To function properly, buffers must have an effective vegetative cover and sufficient width and continuity along the stream. Vegetative cover filters sediment and pollutants reducing the amount of material that may enter a stream. The rate of surface erosion is closely correlated with vegetative cover on the soil surface, such as plant litter. Litter and the stems of vegetation reduce the downslope movement of surface soils. Accelerated surface erosion occurs when these barriers are removed (Strahler et al. 1971).

Riparian vegetation provides shade to help maintain air and water temperature and prevent excessive algal blooms. Reduced shade leads to increased water temperatures. Increased water temperatures can obstruct adult migration and limit spawning success, trigger early juvenile outmigration resulting in decreased survival rates, change juvenile sheltering behavior, reduce disease resistance, and increase metabolic requirements (Taylor 1988). Riparian vegetation also provides allochthonous input to the base of the food web, terrestrial insects for fish consumption, and cover for aquatic vertebrates.

APPENDIX A: STATUS OF SURVEYED REACHES

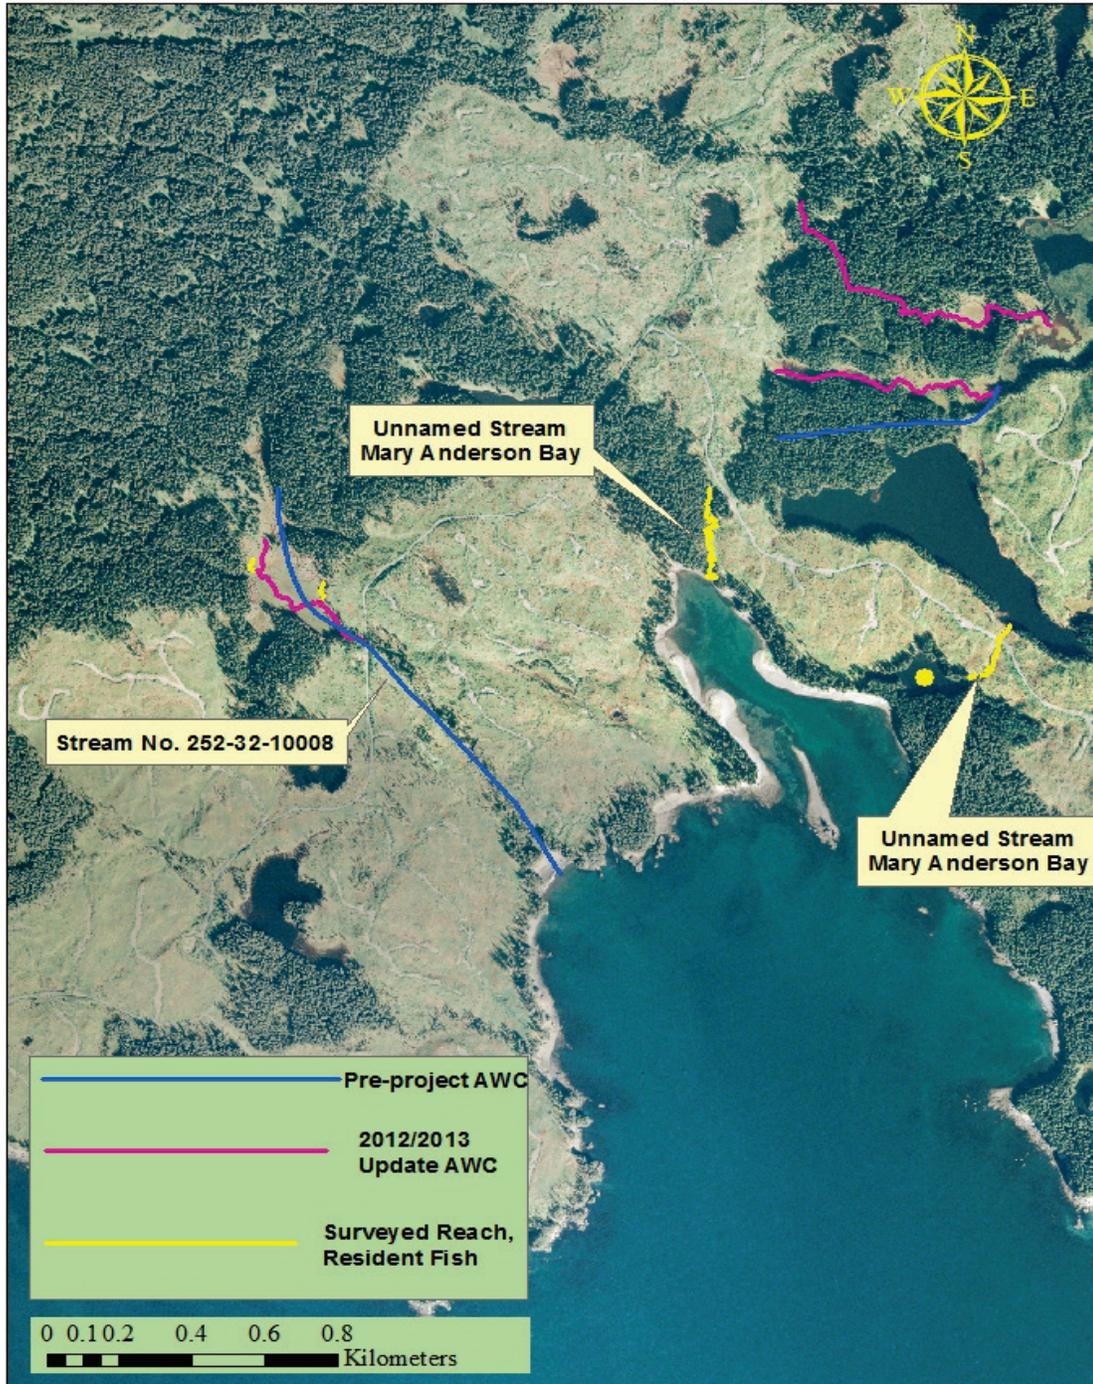

Appendix A1.—Status of surveyed reaches within the Marka River, Afognak Island.

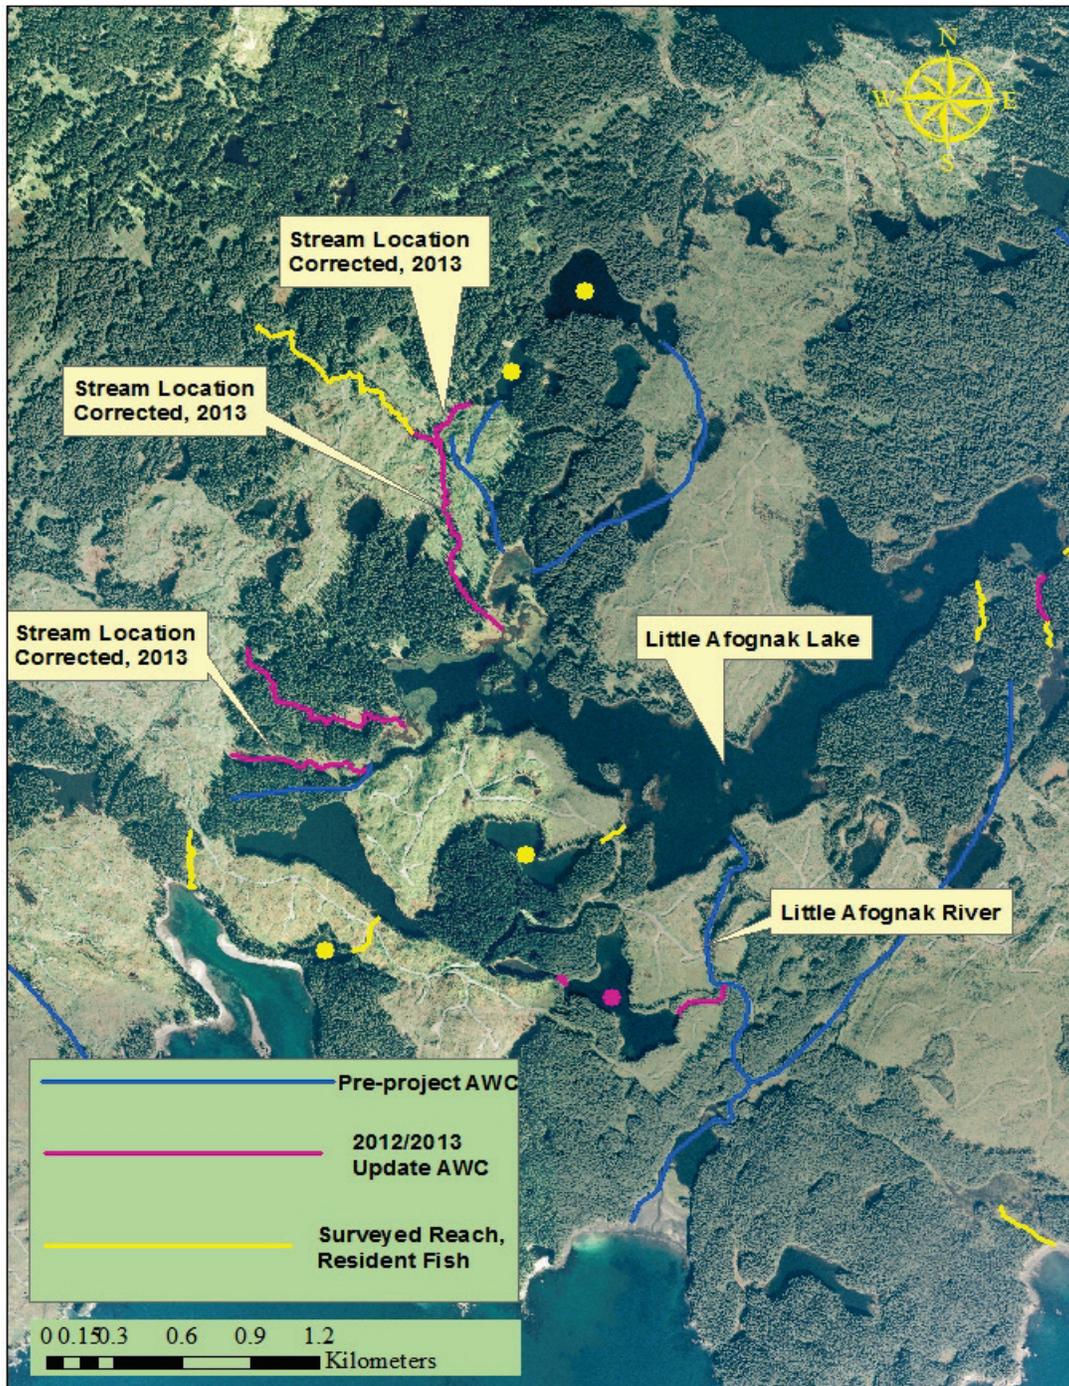

Appendix A2.–Status of surveyed reaches within the Paramanof River, Afognak Island.

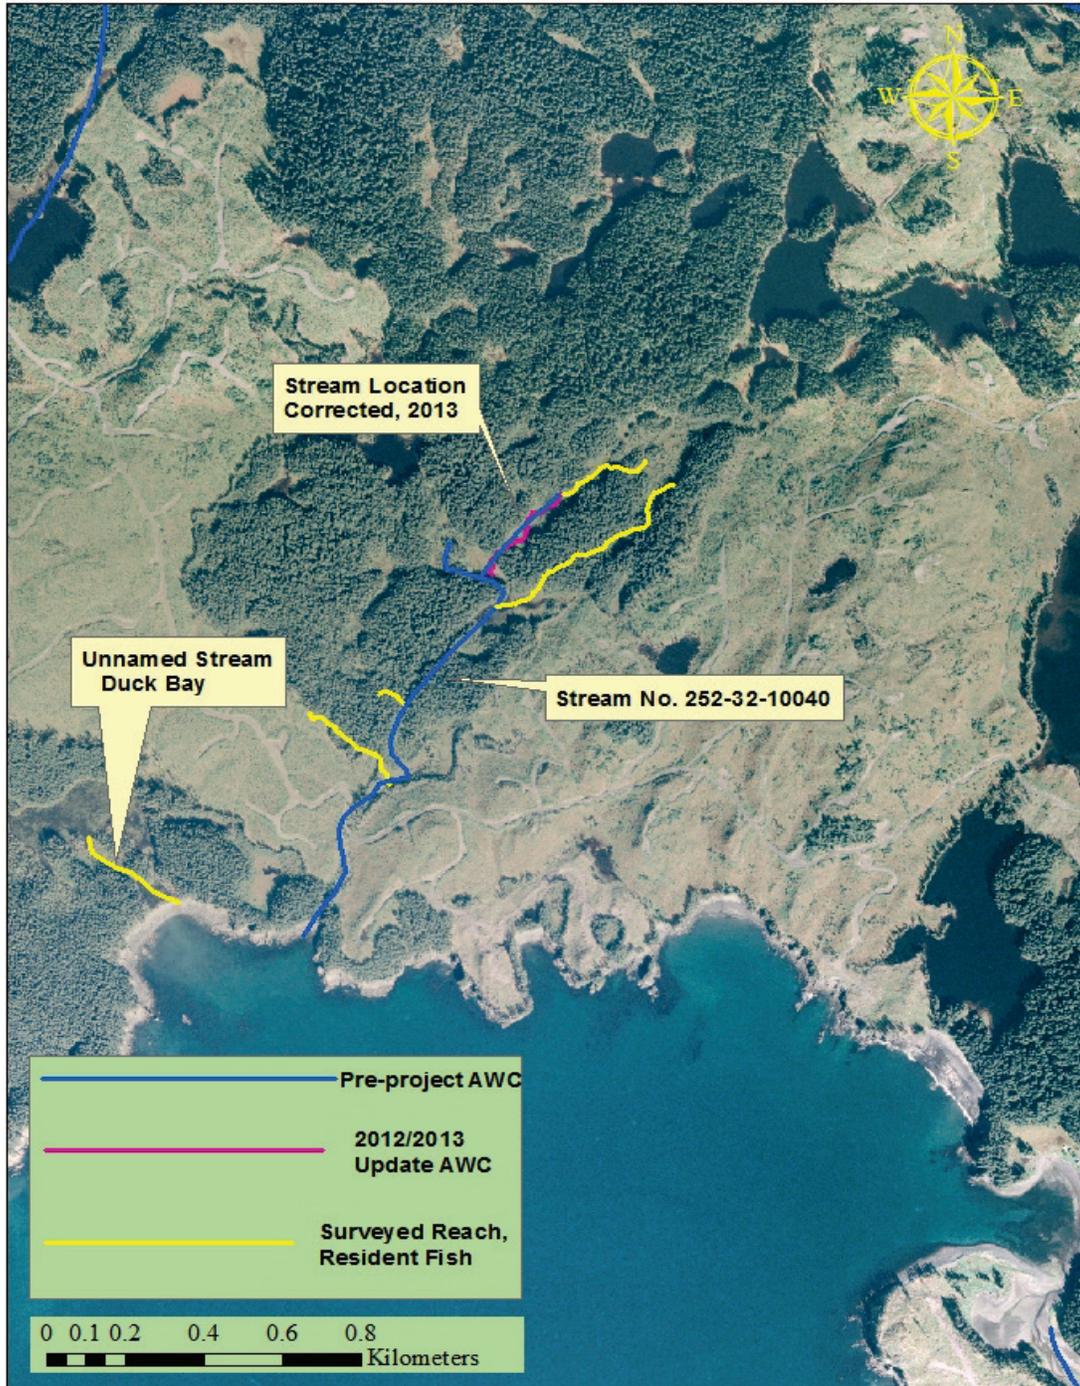

Appendix A3.—Status of surveyed reaches within an unnamed stream, Kazakof Bay and Stream No. 252-32-10004, Afognak Island.

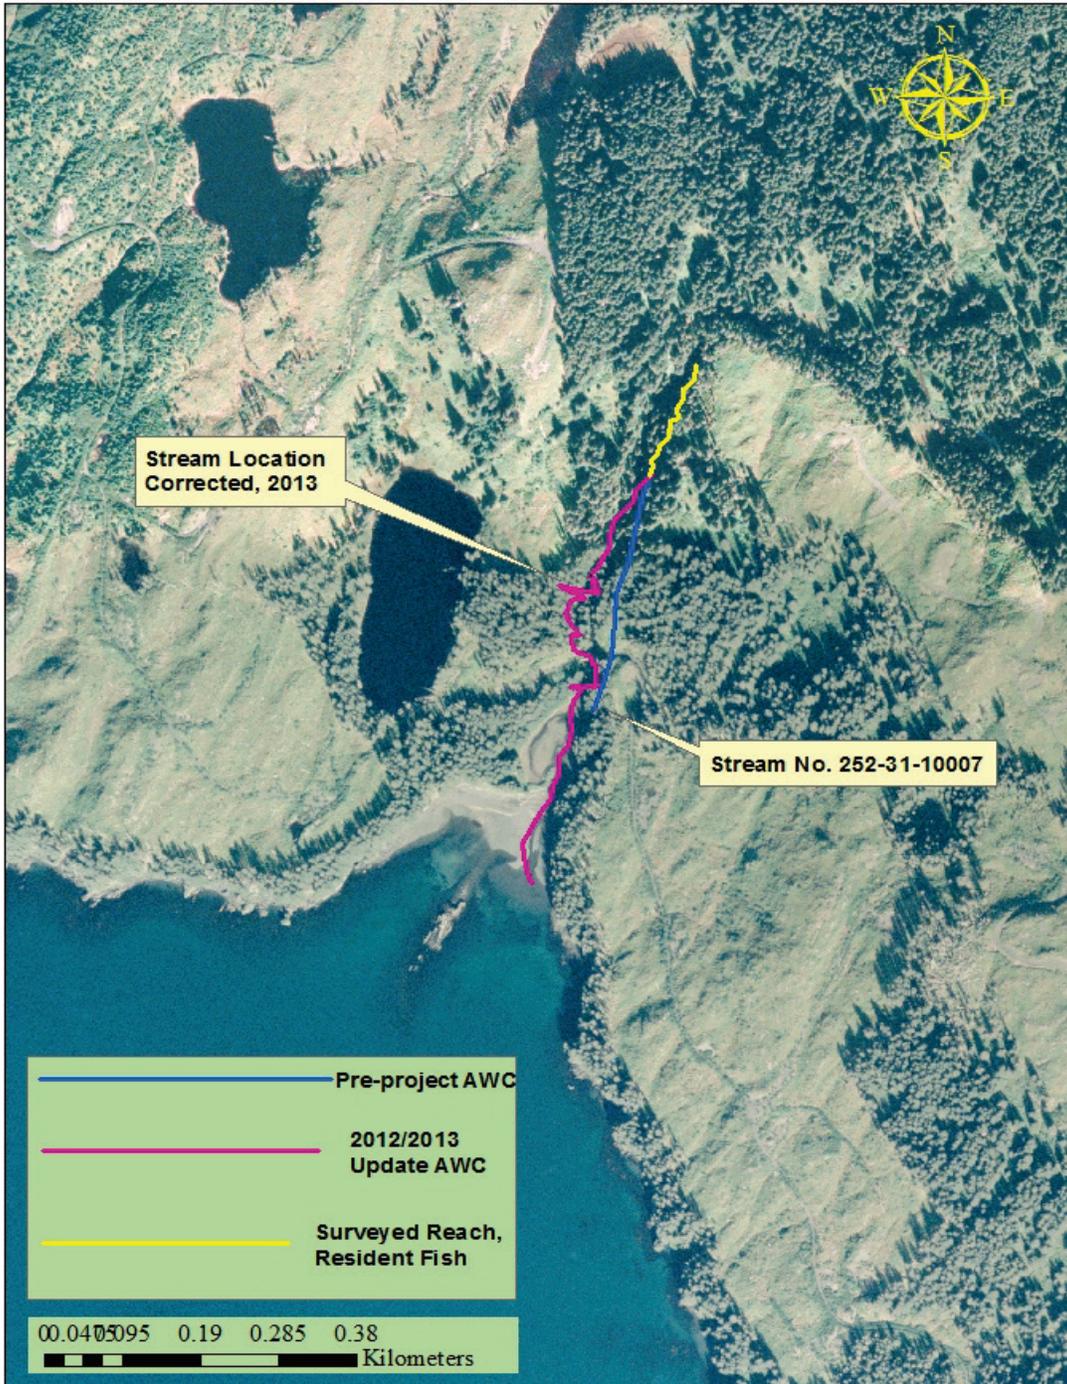

Appendix A4.—Status of surveyed reaches within unnamed streams, Mary Anderson Bay and Stream No. 252-32-10008, Afognak Island.

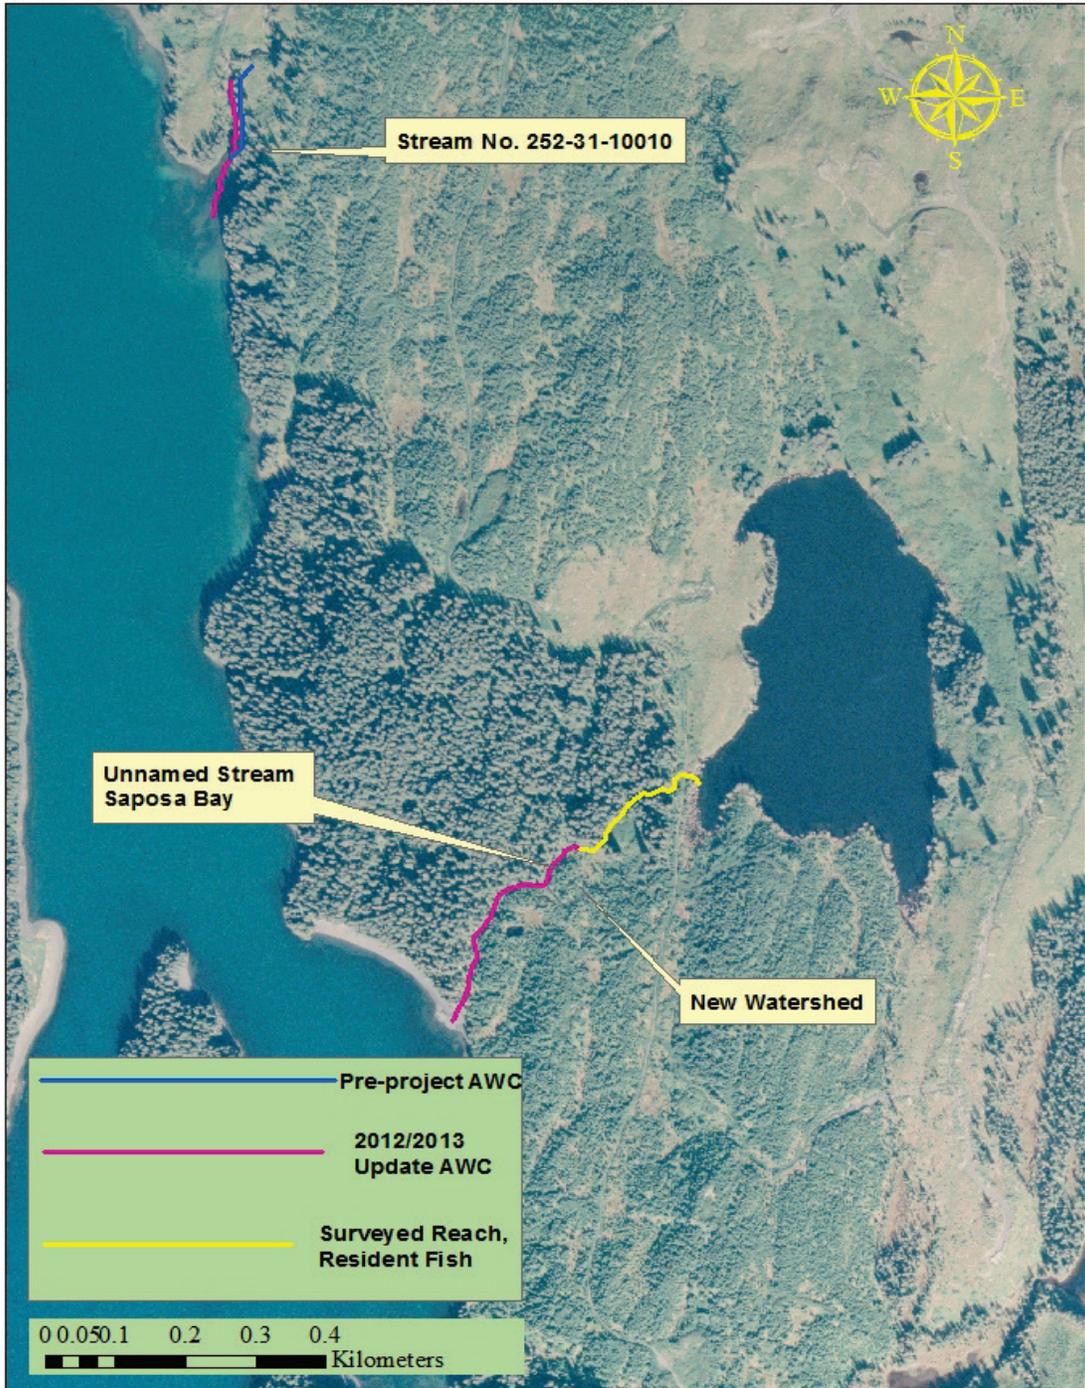

Appendix A5.—Status of surveyed reaches within Little Afognak Lake and Little Afognak River, Afognak Island.

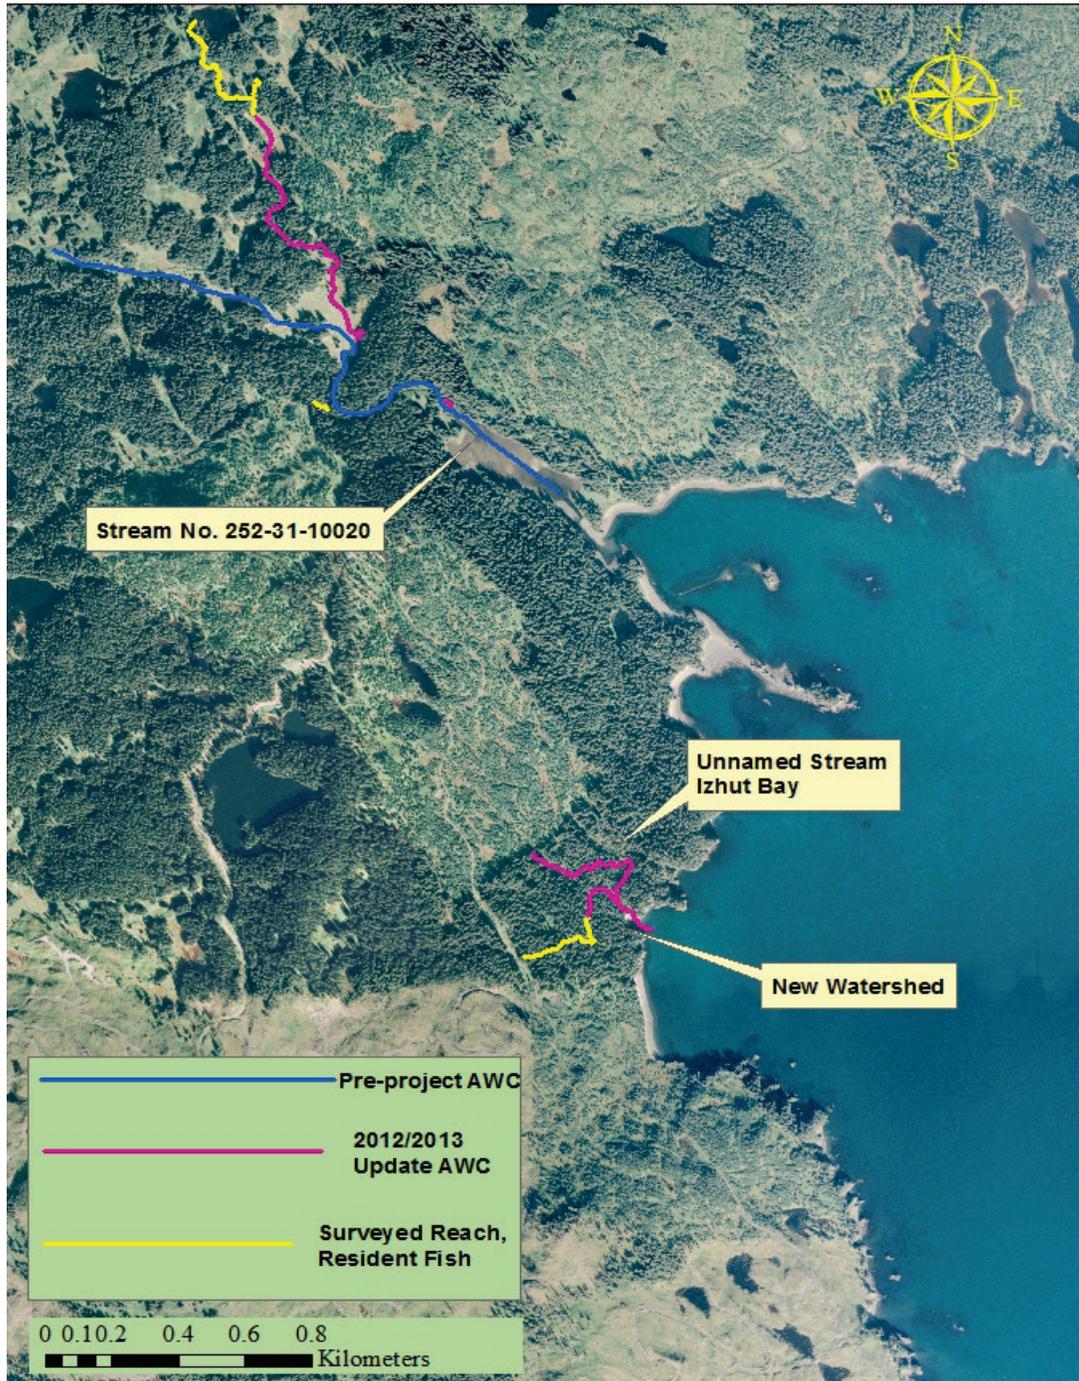

Appendix A6.—Status of surveyed reaches within an unnamed stream, Duck Bay and Stream No. 252-32-10040, Afognak Island.

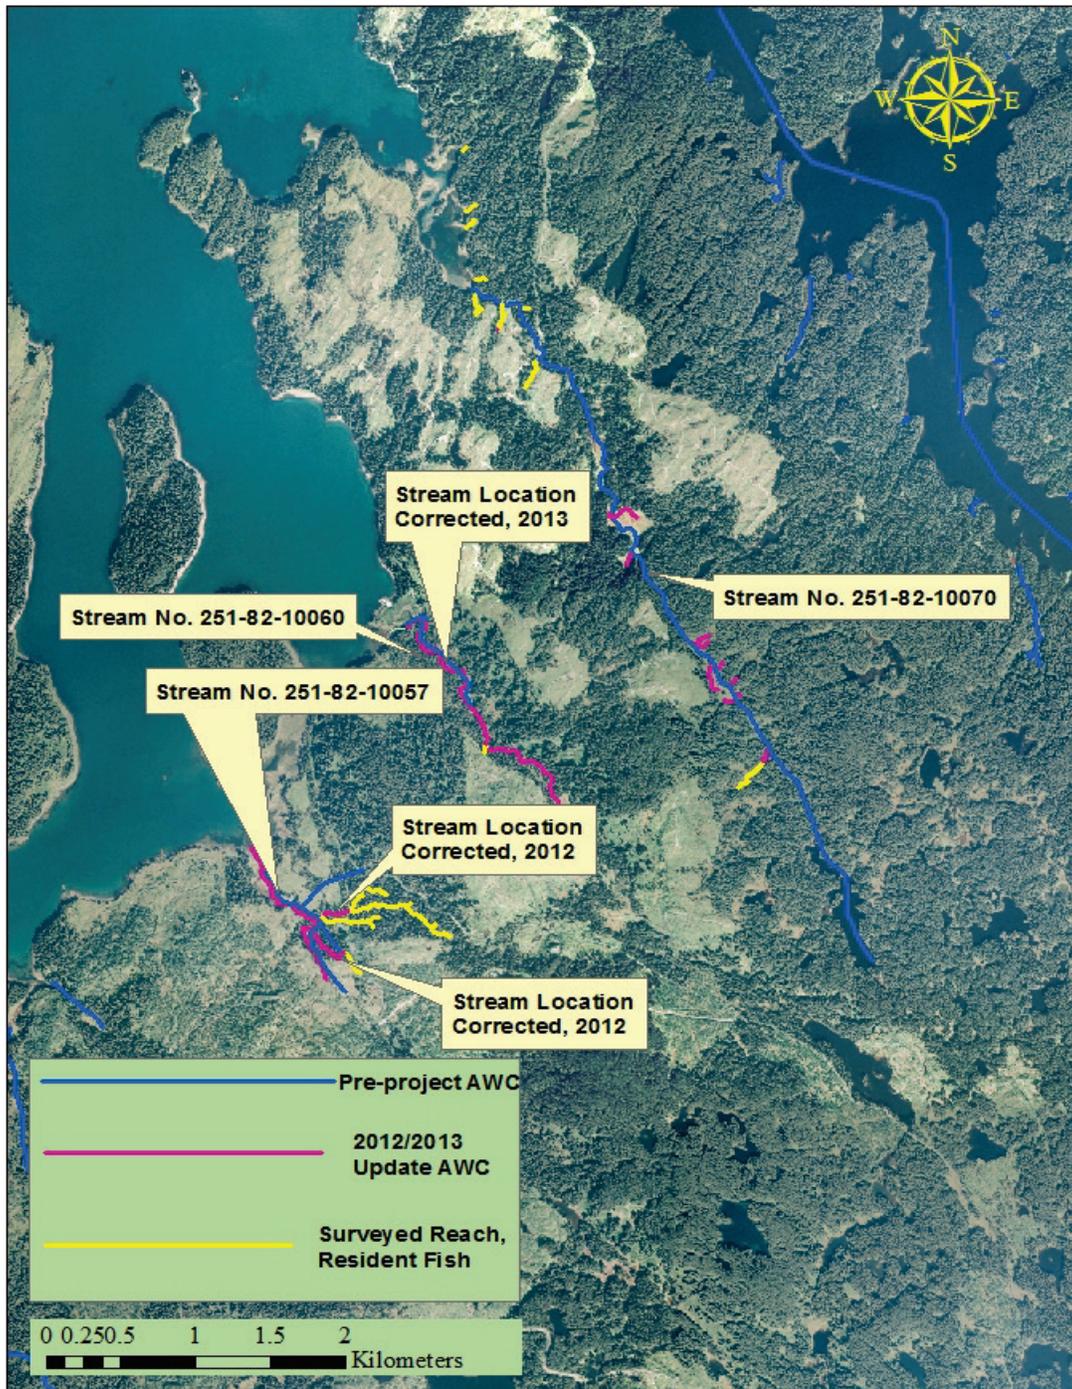

Appendix A7.—Status of surveyed reaches within Stream No. 252-31-10007, Afognak Island.

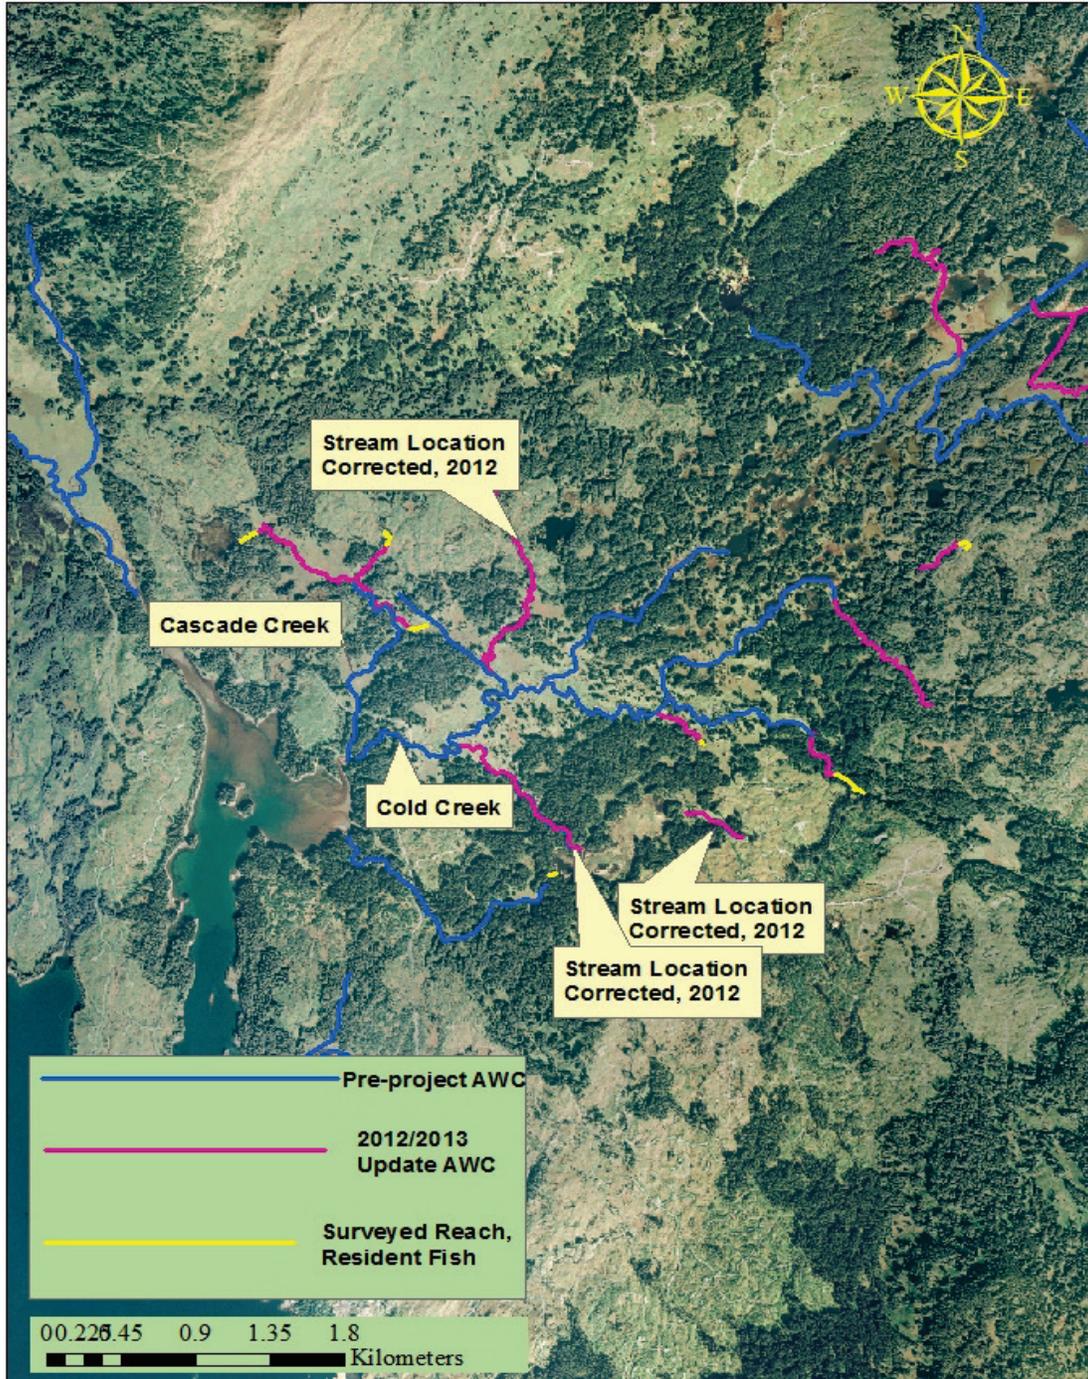

Appendix A8.—Status of surveyed reaches within an unnamed stream, Saposa Bay and Stream No. 252-31-10010, Afognak Island.

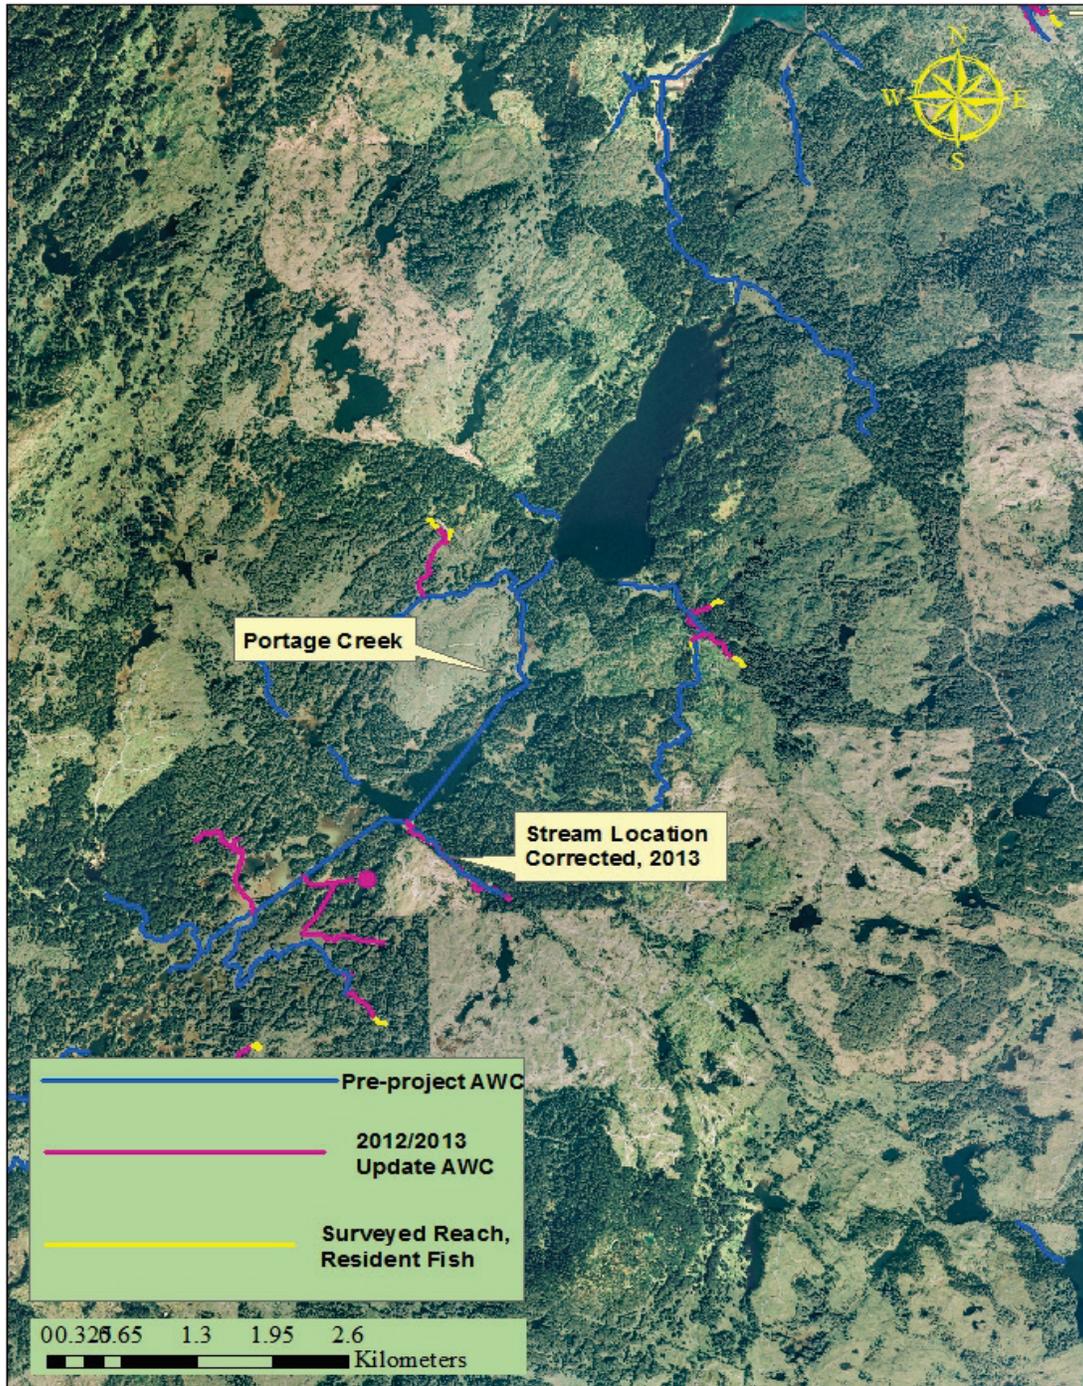

Appendix A9.—Status of surveyed reaches within an unnamed stream, Izhut Bay and Stream No. 252-31-10020, Afognak Island.

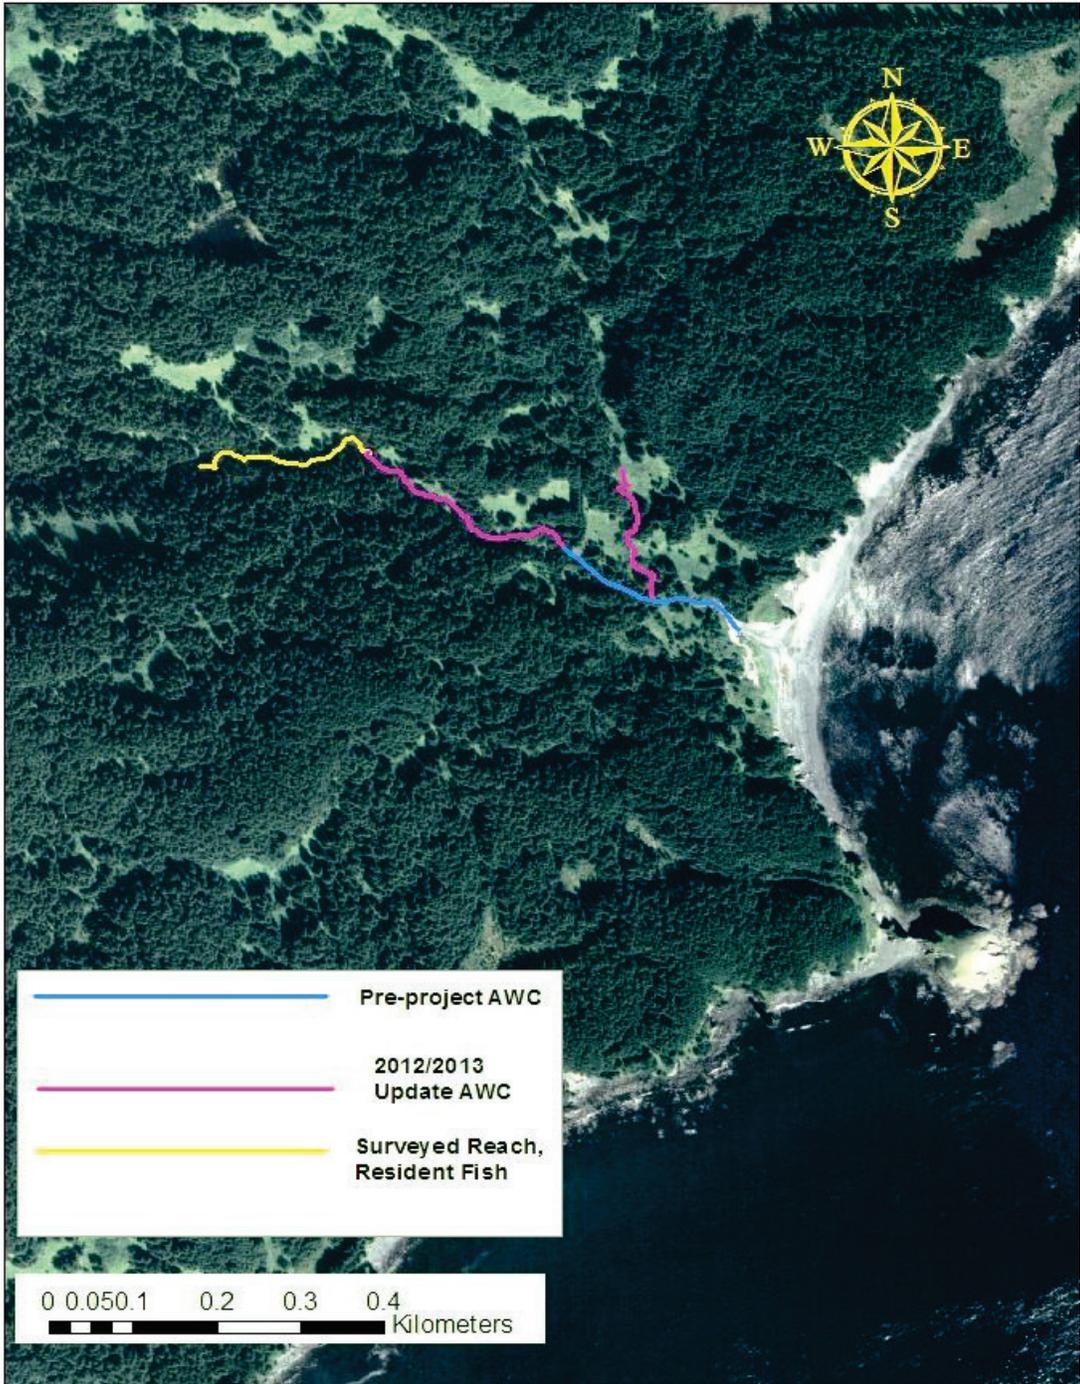

Appendix A10.—Status of surveyed reaches within Stream Nos. 251-82-10057, 251-82-10060, and 251-82-10070, Discoverer Bay, Afognak Island.

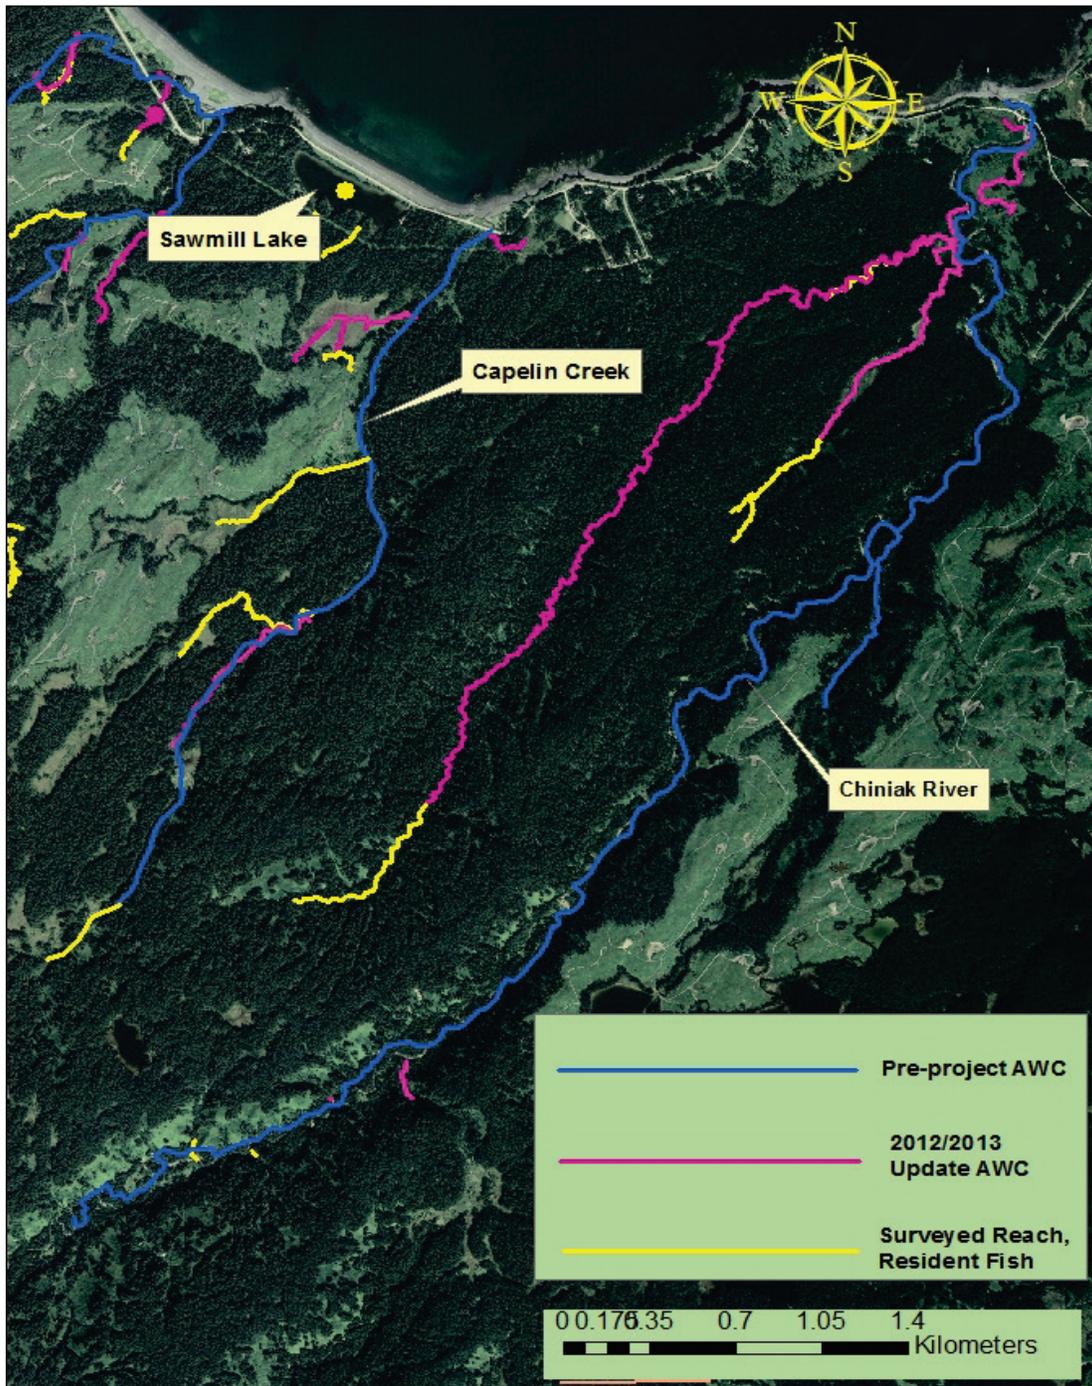

Appendix A11.–Status of surveyed reaches within Cascade Creek and Cold Creek, Afognak Island.

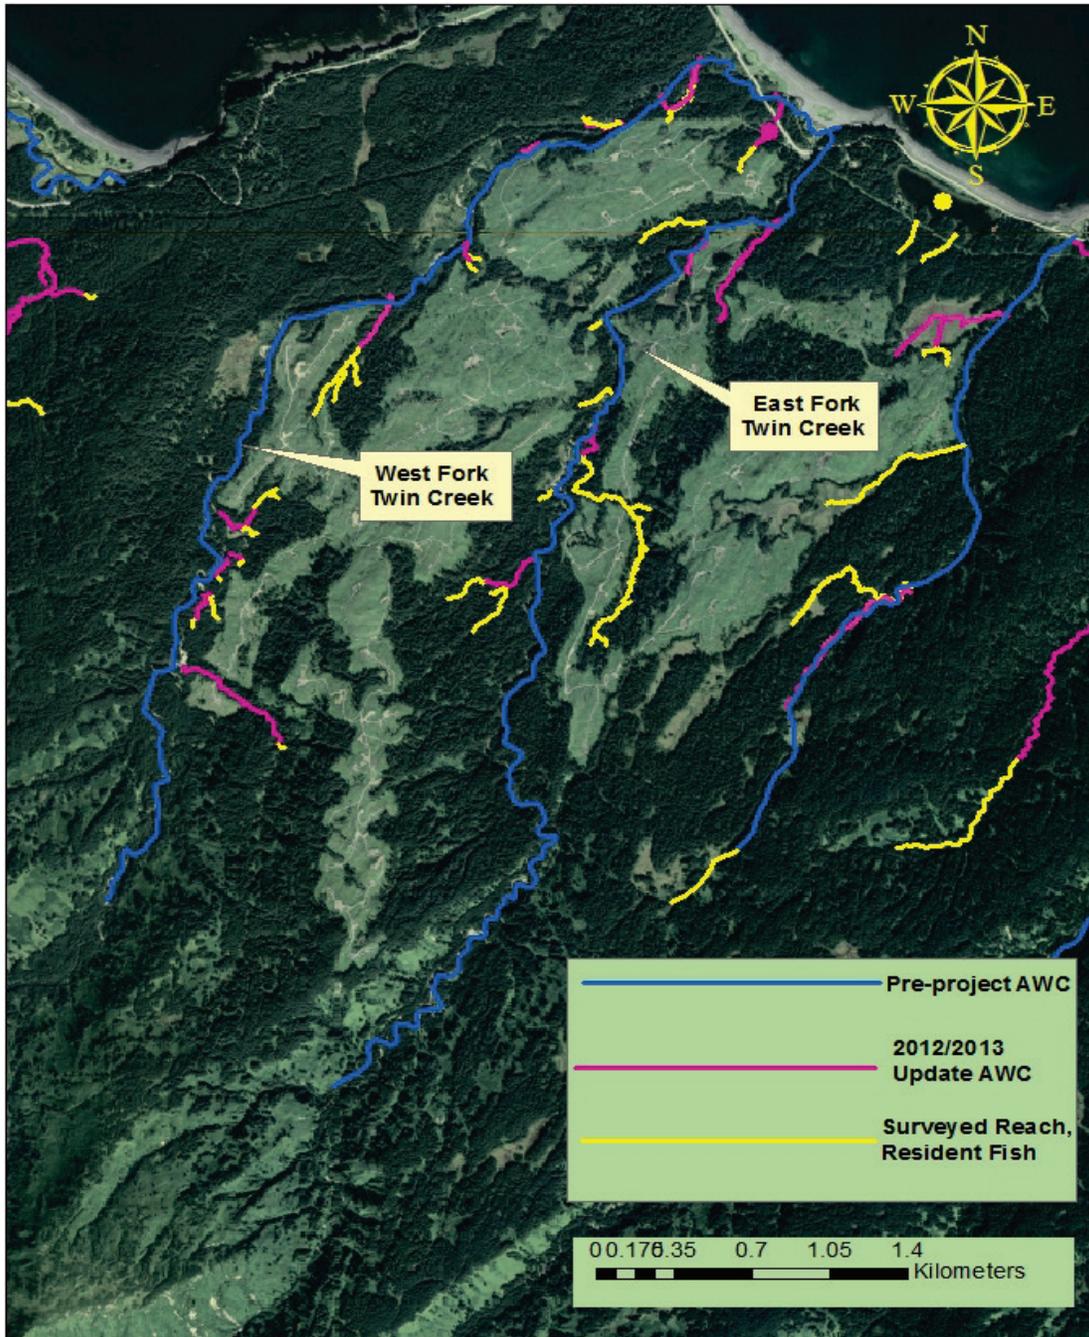

Appendix A12.—Status of surveyed reaches within Portage Creek, Afognak Island.

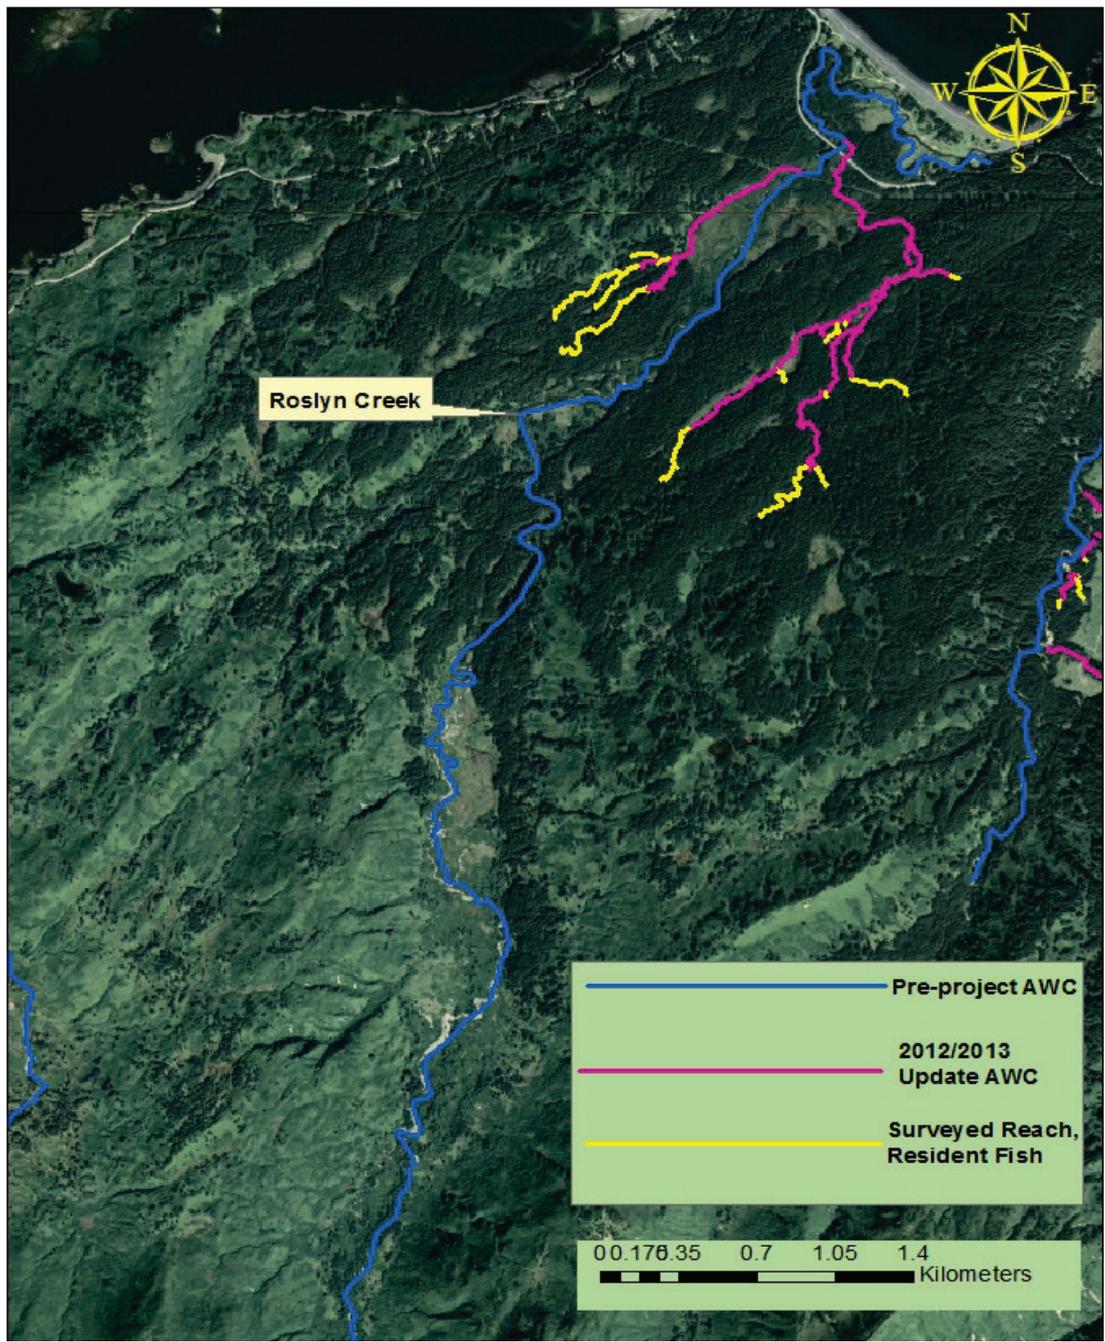

Appendix A13.—Status of surveyed reaches within Sequel Point Creek, Kodiak Island.

Appendix A14.—Status of surveyed reaches within Chiniak River, Capelin Creek, and Sawmill Lake, Kodiak Island.

Appendix A15.—Status of surveyed reaches within East Fork Twin Creek and West Fork Twin Creek, Kodiak Island.

Appendix A16.—Status of surveyed reaches within Roslyn Creek, Kodiak Island.
