## Symbols and Abbreviations

The following symbols and abbreviations, and others approved for the Système International d'Unités (SI), are used without definition in reports by the Divisions of Sport Fish and Commercial Fisheries and Habitat Section. All others, including deviations from definitions listed below, are noted in the text at first mention, as well as in the titles or footnotes of tables, and in figures or figure captions.

<b>Weights and measures (metric)</b>		<b>General</b>	<b>Measures (fisheries)</b>	
centimeter	cm	Alaska Administrative Code	fork length	FL
deciliter	dL	all commonly accepted abbreviations	mideye-to-fork	MEF
gram	g	e.g., Mr., Mrs., AM, PM, etc.	mideye-to-tail fork	METF

## LIST OF APPENDICES

### APPENDIX A: CHLOROPHYLL DATA

- A.1. Lower Slate Creek chlorophylls *a*, *b*, and *c* densities, 2011–2019.
- A.2. West Fork Slate Creek chlorophylls *a*, *b*, and *c* densities, 2011–2019.
- A.3. East Fork Slate Creek chlorophylls *a*, *b*, and *c* densities, 2011–2019.
- A.4. Upper Slate Creek chlorophylls *a*, *b*, and *c* densities, 2011–2019.
- A.5. Lower Sherman Creek SP1 chlorophylls *a*, *b*, and *c* densities, 2011–2019.
- A.6. Lower Sherman Creek SP2 chlorophylls *a*, *b*, and *c* densities, 2011–2019.

### APPENDIX B: BENTHIC MACROINVERTEBRATE DATA

- B.1. Lower Slate Creek BMI data summary, 2011–2019.
- B.2. West Fork Slate Creek BMI data summary, 2011–2019.
- B.3. East Fork Slate Creek BMI data summary, 2011–2019.
- B.4. Upper Slate Creek BMI data summary, 2011–2019.
- B.5. Upper Johnson Creek BMI data summary, 2011–2019.
- B.6. Lower Sherman Creek SP1 BMI data summary, 2011–2019.
- B.7. Lower Sherman Creek SP2 BMI data summary, 2011–2019.

### APPENDIX C: ADULT SALMON DATA

- C.1. Lower Slate Creek weekly adult pink salmon count by reach, 2019.
- C.2. Lower Slate Creek weekly adult coho salmon count by reach, 2019.
- C.3. Lower Johnson Creek weekly adult pink salmon count by reach, 2019.
- C.4. Lower Johnson Creek weekly adult chum salmon count by reach, 2019.
- C.5. Lower Johnson Creek weekly adult coho salmon count by reach, 2019.
- C.6. Lower Sherman Creek weekly adult pink salmon count by reach, 2019.
- C.7. Lower Sherman Creek weekly adult chum salmon count by reach, 2019.
- C.8. Lower Slate Creek adult pink salmon count by statistical week, 2011–2019.
- C.9. Lower Johnson Creek adult pink salmon count by statistical week, 2011–2019.
- C.10. Lower Sherman Creek adult pink salmon count by statistical week, 2011–2019.

### APPENDIX D: SPAWNING SUBSTRATE DATA

- D.1. Lower Slate Creek SP1 pink salmon spawning substrate data, 2011–2019.
- D.2. Lower Slate Creek SP2 pink salmon spawning substrate data, 2011–2019.

### APPENDIX E: SEDIMENT DATA AND LAB REPORT

- E.1. Sediment compositions, 2011–2019.
- E.2. Sediment element concentrations, 2011–2019.
- E.3. Sediment element concentrations lab report, 2019.

## **ACKNOWLEDGEMENTS**

Coeur Alaska, Inc. provided financial support and Kensington Gold Mine environmental staff Kevin Eppers, Casandra Joos, Peter Strow, Ryan Bailey, Chris Salazar, Dylan Williams, and Brittany Blunt provided logistical support and discharge and water quality data.

Habitat Section staff assisted with both field and office work. Habitat Biologist Greg Albrecht assisted with planning field studies and collecting and entering the data. Habitat Biologists Dylan Krull, Evan Fritz, and Jesse Lindgren, and Fish and Wildlife Technician Marc Heifetz assisted with data collection. Mr. Albrecht and Mr. Fritz verified data entry. Mr. Albrecht assisted in processing periphyton samples and benthic macroinvertebrate identification quality control. Mr. Lindgren reviewed the report and assisted with map preparation. Habitat Section Operations Manager Dr. Al Ott and Southeast Regional Supervisor Kate Kanouse reviewed and edited the report. Matthew Kern of Alder Grove Farm identified benthic macroinvertebrates.

Thank you all for your contribution.

## EXECUTIVE SUMMARY

Since 2011, the Alaska Department of Fish and Game Habitat Section has completed the aquatic resource monitoring the U.S. Forest Service and Alaska Department of Environmental Conservation require for Coeur Alaska Inc.'s Kensington Gold Mine. This partnership provides the Alaska Department of Fish and Game the opportunity to gather and review data throughout the year, and help identify, assess, and resolve issues at the mine as they arise.

The National Weather Service (2020) reports the Juneau area continued to be categorized as in moderate drought during 2019, which began in mid-2017, and experienced warmer than normal temperatures with annual precipitation (154 cm) about 3% below normal and snowfall (110 cm) about 50% below normal. Low snowpack early in the year and little precipitation spring through summer contributed to low streamflows regionwide.

The summer 2019 mean chlorophyll *a* density among periphyton samples collected at Lower and Upper Slate Creek was greater than mean densities observed since 2011; mean chlorophyll *a* density at other sampling sites were similar to mean densities previously observed. We also sampled periphyton in Lower Slate Creek and East Fork Slate Creek in early May to continue monitoring for changes that may occur from the tailings treatment facility and found similar mean chlorophyll *a* densities compared to previous spring sampling results.<sup>a</sup>

The spring 2019 mean benthic macroinvertebrate density was among the lowest observed at Lower and Upper Slate Creek sampling sites; mean density at other sampling sites was similar to mean densities previously observed. The 2019 Lower Sherman Creek mean benthic macroinvertebrate density for each sampling site was greater than observed 2017–2018 and the proportion of insects classified under the orders Ephemeroptera, Plecoptera, and Trichoptera among the 2018 and 2019 samples were greater than observed 2014–2017.

We observed a comparatively weak pink salmon *Oncorhynchus gorbuscha* return in Lower Slate Creek in 2019, given the strong parent year return in 2017. The pink salmon return observed in Johnson and Sherman Creeks also was comparatively low for the dominant odd-year populations in these systems. Low streamflows inhibited fish passage throughout the spawning season. We cannot quantify marine survival factors influencing adult salmon returns so are unable to attribute changes in adult salmon abundance to construction or operation of the Kensington Gold Mine.

The geometric mean particle size of pink salmon spawning gravel in Lower Slate Creek has increased by several millimeters at both sample sites since we began sampling in 2011.

Most element concentrations in the 2019 sediment samples were within the ranges observed at each site since 2011; in Lower Slate Creek we observed lower concentrations of aluminum and chromium, and in Lower Sherman Creek we observed a greater arsenic concentration. Arsenic, copper, nickel, and zinc concentrations at each site remain near or above freshwater sediment toxicity screening guidelines, and we observed additional element concentrations above the guidelines at East Fork and Upper Slate Creeks. While we find sediment guidelines useful for evaluating the sample data, we recognize organisms may respond differently in nature.

---

<sup>a</sup> Bill Kane, Habitat Biologist, to Kate Kanouse, Southeast Regional Supervisor, ADF&G Habitat Section. Memorandum: 2019 Kensington Gold Mine periphyton; dated 1/6/2020. Unpublished document can be obtained from the Southeast Regional Supervisor, ADF&G Habitat Section, 802 3<sup>rd</sup> Street, Douglas, AK.

## INTRODUCTION

The Kensington Gold Mine is located near Berners Bay in Southeast Alaska (Figure 1), about 72 km north of Juneau and 56 km south of Haines within the City and Borough of Juneau and the Tongass National Forest (Tetra Tech Inc. et al. 2004a, 2004b). The mine is owned and operated by Coeur Alaska Inc. (Coeur), a wholly owned subsidiary of Coeur Mining Inc.

The underground mine began producing gold concentrate for export on June 24, 2010. Tailings are disposed underground as paste backfill and in the tailings treatment facility (TTF) as slurry through a pipeline from the mill. Mine infrastructure is located in three drainages that support resident and anadromous fish: the TTF and water treatment plant in the Slate Creek drainage; the waste rock pile, camp, and mill facilities in the Johnson Creek drainage; and the waste rock pile and mine water treatment plant in the Sherman Creek drainage.

Contractors gathered aquatic data for the Kensington Gold Mine from the late 1980s through 2005, which provided a basis for the Alaska Department of Fish and Game (ADF&G) Habitat Section permit decisions, Plan of Operations monitoring requirements (Coeur 2005), the U.S. Environmental Protection Agency (USEPA) National Pollutant Elimination Discharge System Permit No. AK-005057-1, and the Alaska Department of Environmental Conservation Alaska Pollutant Elimination System (APDES) Permit No. AK0050571.<sup>b</sup> Monitoring and research reports published during project development and operations are in Aquatic Science Inc. (2006, 2007, 2008, 2009a, 2009b, 2009c, 2009d, 2011), Timothy and Kanouse (2012, 2013, 2014), Kanouse (2015), Brewster (2016), Willson-Naranjo and Kanouse (2016), Kanouse and Zutz (2017), Zutz (2018), and Albrecht (2018, 2019).

Habitat Section staff completed the aquatic studies required for the Kensington Gold Mine in Slate, Johnson, and Sherman Creeks since 2011. The APDES Permit requires sampling periphyton, benthic macroinvertebrates (BMI), and sediment. We assess stream health using estimates of chlorophyll density and composition, BMI density and community composition, pink salmon spawning substrate composition, and sediment element concentrations. Habitat Section staff also completed the adult salmon counts required in the project Plan of Operations (Coeur 2005).

## PURPOSE

This technical report summarizes the 2019 aquatic study data and documents the condition of biological communities and sediments in Slate, Johnson, and Sherman Creeks near mine development and operations, satisfying the aquatic study requirements in the project Plan of Operations (Coeur 2005) and APDES Permit AK0050571.

---

<sup>b</sup> Contractor reports are listed in Zutz (2018).

Figure 1.—Kensington Gold Mine project area map.

## AQUATIC STUDIES

We completed the Kensington Gold Mine aquatic studies required in the project Plan of Operations (Coeur 2005) and APDES Permit AK0050571 (Table 1).

Table 1.—Aquatic studies required by the Plan of Operations and APDES permit, 2019.

Location	Description	Aquatic Study	Frequency
Lower Slate Creek	1 km reach between the stream mouth in Slate Cove and a 25 m waterfall.	Chlorophyll density and composition	1/year
		Benthic macroinvertebrate density and composition	1/year
		Adult salmon counts	Seasonally
		Spawning substrate composition	1/year
		Sediment composition and element concentrations	1/year
West Fork Slate Creek	A tributary to Lower Slate Creek, upstream of a waterfall and mine influence.	Chlorophyll density and composition	1/year
		Benthic macroinvertebrate density and composition	1/year
East Fork Slate Creek	A tributary to Lower Slate Creek, 1 km reach between the TTF plunge pool and waterfall at Lower Slate Creek.	Chlorophyll density and composition	1/year
		Benthic macroinvertebrate density and composition	1/year
		Sediment composition and element concentrations	1/year
Upper Slate Creek	A tributary to Upper Slate Lake and upstream of mine influence.	Chlorophyll density and composition	1/year
		Benthic macroinvertebrate density and composition	1/year
		Sediment composition and element concentrations	1/year
Lower Johnson Creek	1.5 km reach between the stream mouth in Berners Bay and a 30 m waterfall.	Adult salmon counts	Seasonally
		Sediment composition and element concentrations	1/year
Upper Johnson Creek	Upstream of Bridge #2 to the headwaters, adjacent to the upper camp and mill bench.	Benthic macroinvertebrate density and composition	1/year
Lower Sherman Creek	360 m reach between the stream mouth in Lynn Canal and a 15 m waterfall.	Chlorophyll density and composition	1/year
		Benthic macroinvertebrate density and composition	1/year
		Adult salmon counts	Seasonally
		Sediment composition and element concentrations	1/year

## STUDY AREA

### Slate Creek Drainage

Slate Creek drains a 10.5 km<sup>2</sup> watershed into Slate Cove on the northwest side of Berners Bay (Coeur 2005; Figure 2). Two waterfalls at the confluence of East and West Forks, about 1 km upstream of the mouth of Lower Slate Creek, prevent upstream fish migration. East Fork Slate Creek flows between the TTF dam plunge pool and the waterfall at Lower Slate Creek. Coeur operates the TTF in Lower Slate Lake and discharges TTF water treatment plant effluent (Outfall 002)<sup>c</sup> to East Fork Slate Creek. Upstream of the TTF, a concrete dam diverts water from Upper Slate Lake through a diversion pipeline and into East Fork Slate Creek at the TTF dam plunge pool, bypassing the TTF. Upper Slate Creek is the inlet to Upper Slate Lake.

<sup>c</sup> Outfall 002 began discharging to East Fork Slate Creek in December 2010.

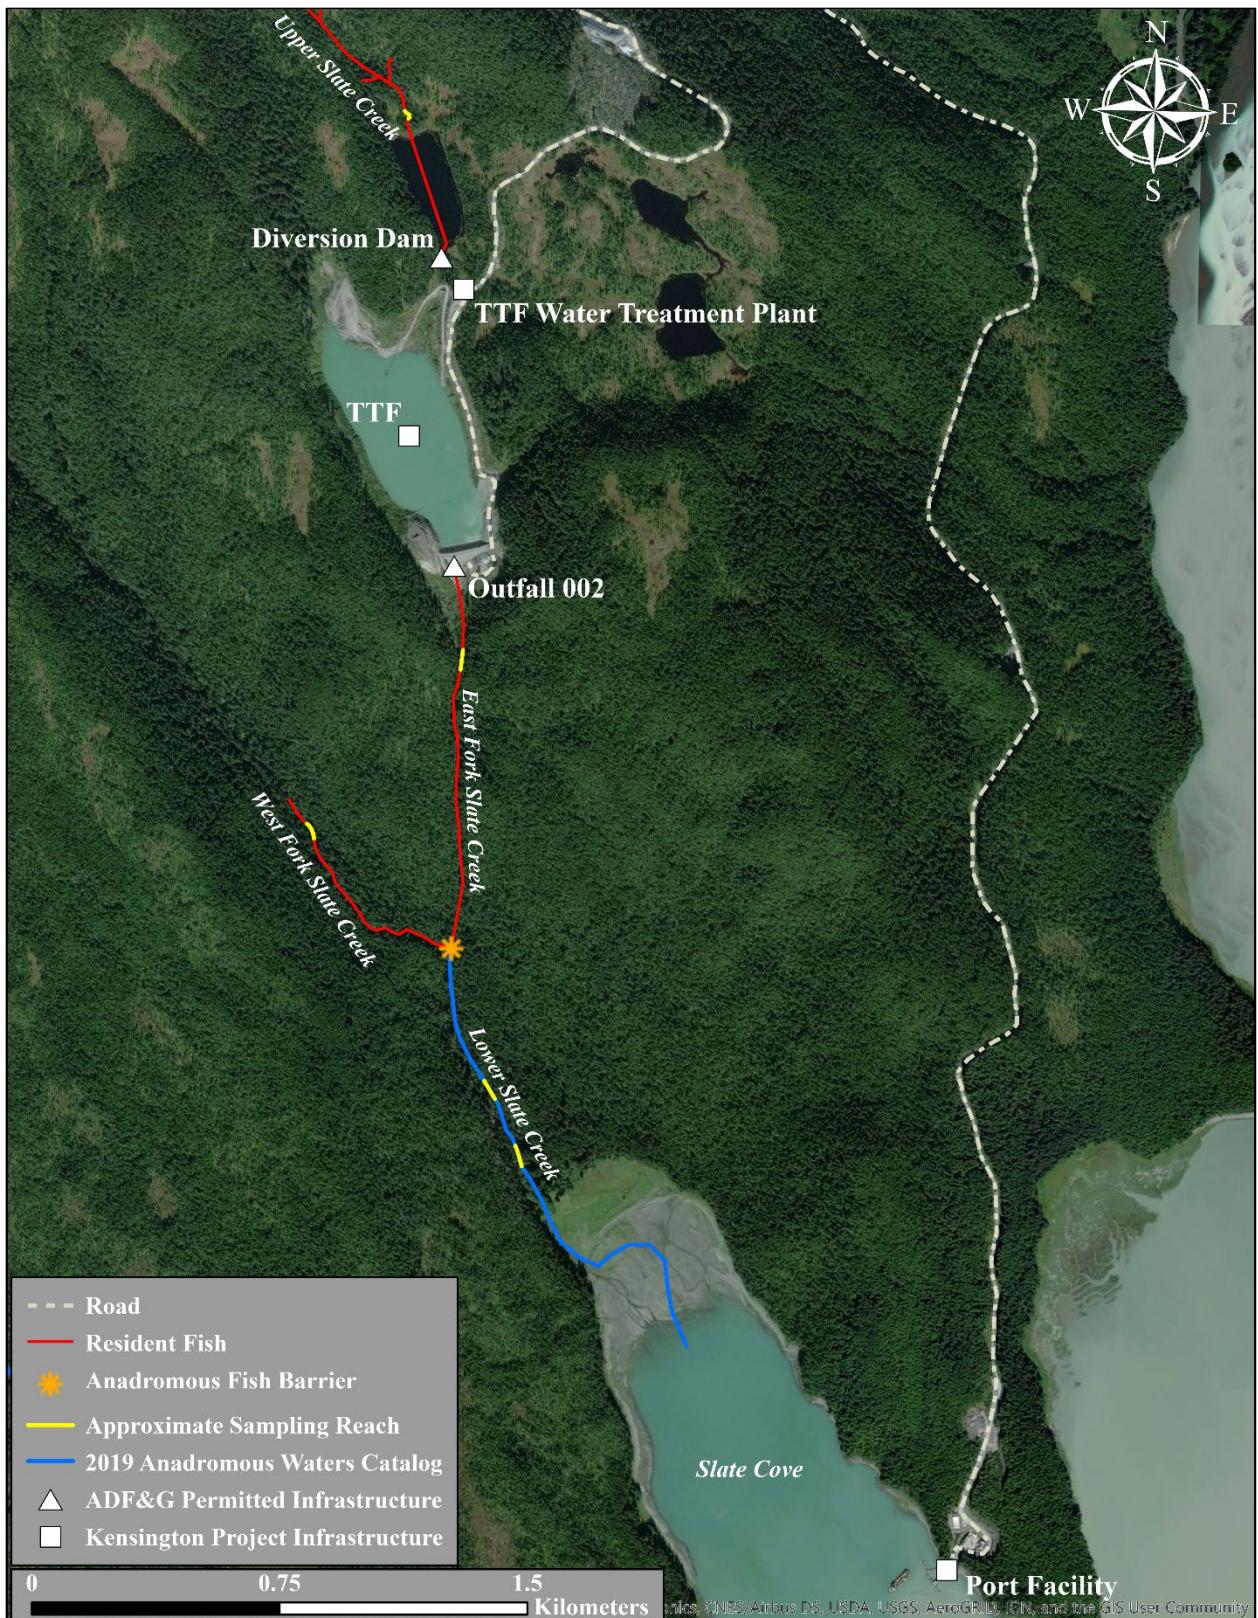

Figure 2.—Slate Creek map.

### **Lower Slate Creek**

Lower Slate Creek provides spawning habitat for chum *O. keta*, coho *O. kisutch*, and pink salmon, and eulachon *Thaleichthys pacificus*, and rearing habitat for coho salmon (Stream No. 115-20-10030; Johnson and Blossom 2019). We also have documented juvenile Dolly Varden char *Salvelinus malma* and adult cutthroat trout *O. clarkii* in the system (Timothy and Kanouse 2012).

Lower Slate Creek is a mixture of water from the East and West Forks, Outfall 002, and Upper Slate Lake. We sample periphyton, BMIs, pink salmon spawning substrate, and sediment at Sample Point 1 (SP1; Figure 3) and pink salmon spawning substrate at Sample Point 2 (SP2; Figure 4), both a moderate gradient (2–6%) mixed control channel type (Paustian 2010), and count adult salmon throughout Lower Slate Creek.

Figure 3.—Lower Slate Creek at SP1, August 1, 2019.

Figure 4.—Lower Slate Creek at SP2, July 25, 2019.

### ***West Fork Slate Creek***

West Fork Slate Creek (Figure 5) provides habitat for Dolly Varden char (Timothy and Kanouse 2014) and is not influenced by the mine. We sample periphyton and BMIs about 600 m upstream of the waterfall at Lower Slate Creek in a cobble-dominated moderate gradient mixed control channel (Paustian 2010).

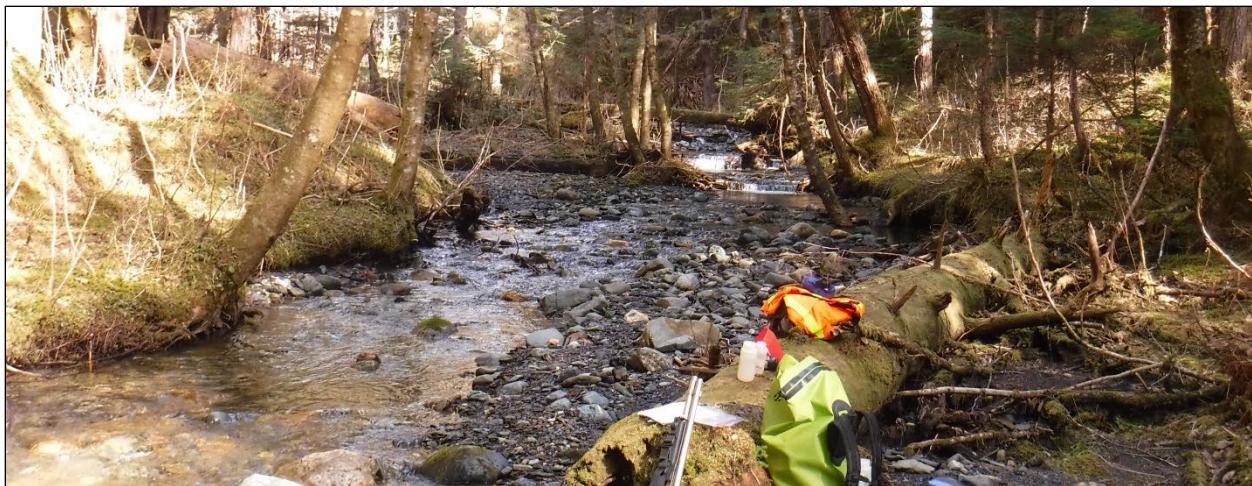

Figure 5.—West Fork Slate Creek, May 1, 2019.

### ***East Fork Slate Creek***

East Fork Slate Creek (Figure 6) provides habitat and a corridor for Dolly Varden char and threespine stickleback *Gasterosteus aculeatus* (Kanouse and Zutz 2017) emigrating from Upper Slate Lake, currently via the diversion pipeline and formerly via Lower Slate Lake. East Fork Slate Creek discharge is dependent on Upper Slate Lake discharge, routed through the diversion pipeline bypassing the TTF, and Outfall 002 effluent discharge from the TTF water treatment plant.<sup>d</sup> We sample periphyton, BMIs, and sediments in East Fork Slate Creek within 200 m downstream of the TTF in a moderate gradient bedrock contained channel (Paustian 2010) where angular cobble substrate is dominant.

Since August 2011, Coeur staff sampled surface waters monthly in and around the TTF for ammonia, chlorophyll *a*, nitrate, nitrite, organic carbon, phosphorus, potassium, and sulfur to investigate the cause of recurring algal blooms (unpublished data obtained from P. Strow, Senior Environmental Coordinator, Coeur Alaska, Inc., Juneau).

---

<sup>d</sup> Daily mean discharge data combining the diversion pipeline and Outfall 002 data for July was presented 2011–2018 (Albrecht 2019).

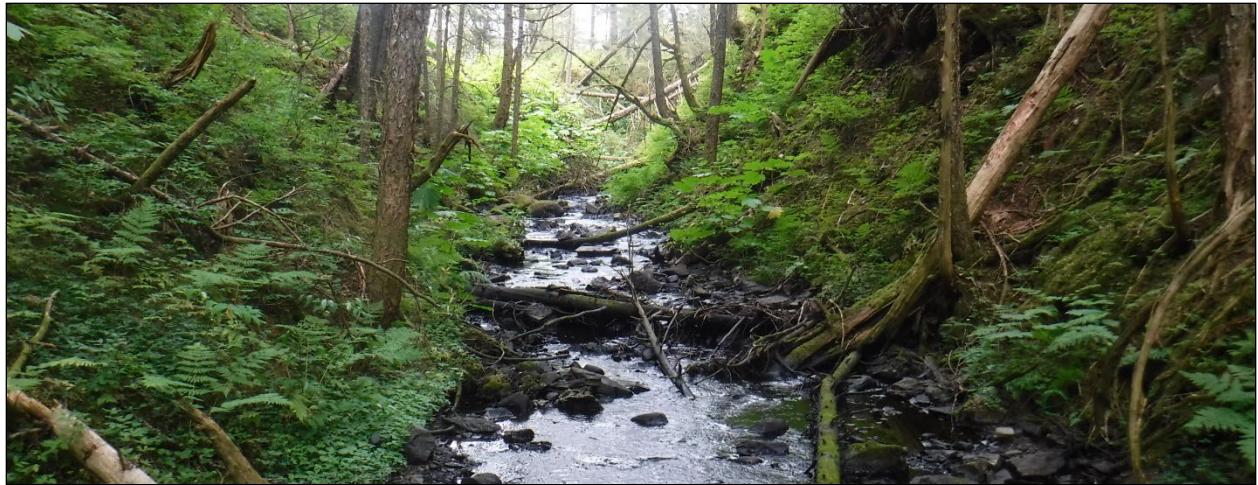

Figure 6.—East Fork Slate Creek, August 1, 2019.

### ***Upper Slate Creek***

Upper Slate Creek (Figure 7) provides habitat for Dolly Varden char (Albrecht 2018) and is not influenced by the mine. We sample periphyton, BMIs, and sediments in Upper Slate Creek within 75 m of Upper Slate Lake in a moderate gradient mixed control channel (Paustian 2010).

Figure 7.—Upper Slate Creek, April 30, 2019.

### **Johnson Creek Drainage**

Johnson Creek drains a 14.6 km<sup>2</sup> watershed to the Lace River on the northwest shore of Berners Bay (Coeur 2005; Figure 8). A 30 m waterfall about 1.5 km upstream of the Lower Johnson Creek mouth prevents upstream fish migration. Middle Johnson Creek is the 2.5 km reach between the waterfall and Jualin Road Bridge #2. Upper Johnson Creek is the reach upstream of Jualin Road Bridge #2 to the headwaters.

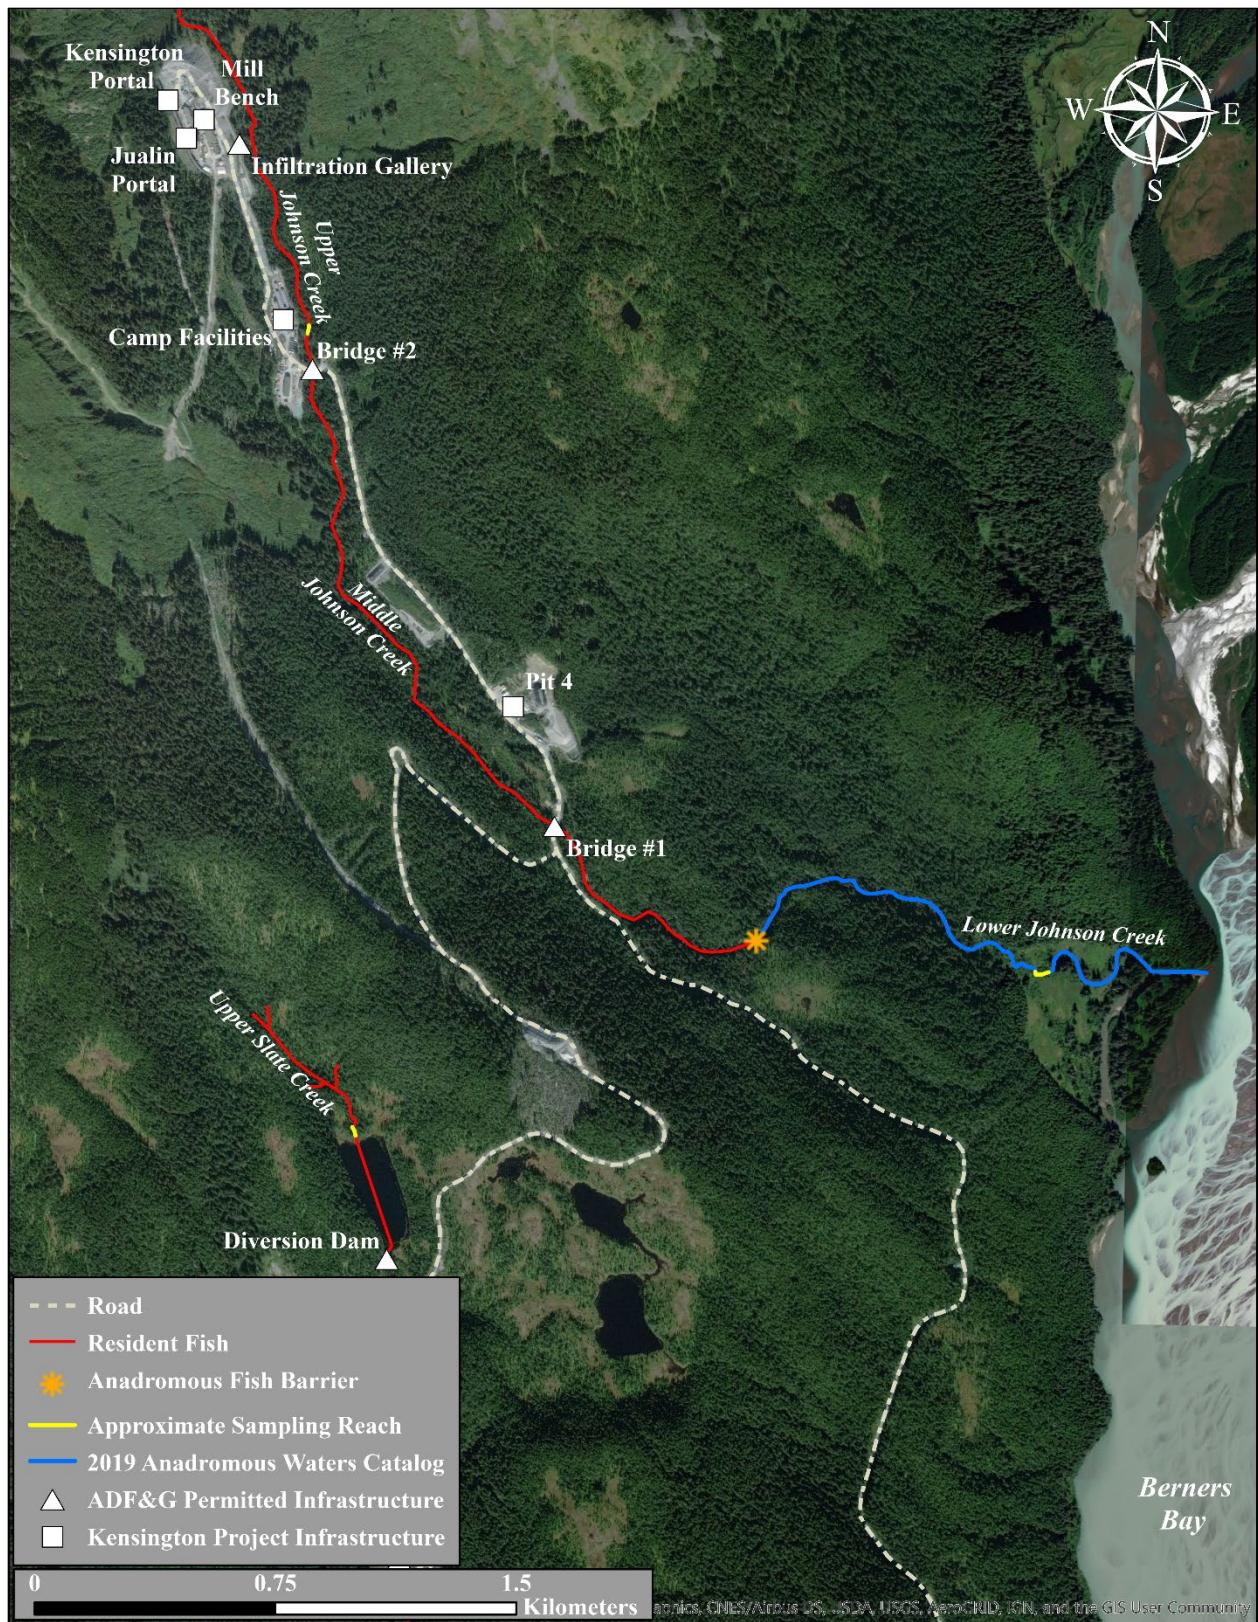

Figure 8.—Johnson Creek map.

### ***Lower Johnson Creek***

Lower Johnson Creek provides spawning habitat for chum, coho, and pink salmon, and rearing habitat for coho salmon (Stream No. 115-20-10030; Johnson and Blossom 2019). We also have documented Dolly Varden char and cutthroat trout in the system (Timothy and Kanouse 2012). Lower Johnson Creek is a mixture of drainages near and from mine infrastructure in Middle<sup>e</sup> and Upper Johnson Creeks. We sample sediment about 600 m upstream from the mouth in a moderate width low gradient (less than 2%) floodplain channel (Paustian 2010) and count adult salmon throughout Lower Johnson Creek (Figure 9).

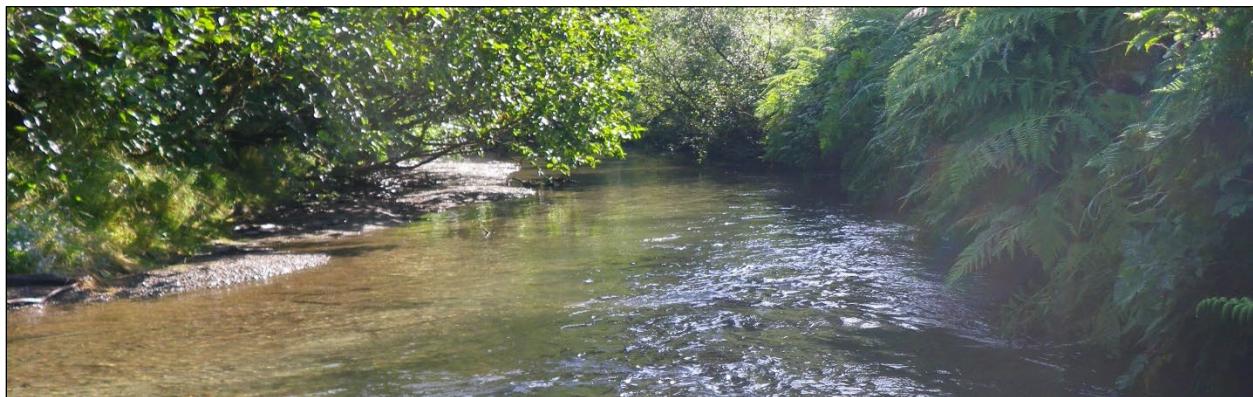

Figure 9.–Lower Johnson Creek, July 22, 2019.

### ***Upper Johnson Creek***

Upper Johnson Creek provides habitat for Dolly Varden char (Timothy and Kanouse 2012) and flows adjacent to the camp facilities, mill bench, Kensington and Jualin portals, and the waste rock pile. Water is collected through an infiltration gallery in Upper Johnson Creek near the mill bench to support the camp. We sample BMIs about 50 m upstream of Jualin Road Bridge #2 (Figure 10) where the stream is a medium width mixed control channel (Paustian 2010) with boulder and cobble substrate.

Figure 10.–Upper Johnson Creek, May 1, 2019.

<sup>e</sup> Mine facilities include the domestic wastewater treatment plant, warehouse, reclamation material and acid-generating rock storage piles, bridges, and Pit 4; drainages include Snowslide Gulch, the domestic wastewater outfall, and storm water discharges; aquatic studies are not required in Middle Johnson Creek.

## Sherman Creek Drainage

Sherman Creek drains a 10.84 km<sup>2</sup> watershed to the east shore of Lynn Canal (Coeur 2005; Figure 11). A 15 m waterfall about 360 m upstream from the Lower Sherman Creek mouth prevents upstream fish migration. Middle Sherman Creek is the 2 km reach between the waterfall and the Comet Beach Road bridge. Upper Sherman Creek is the reach upstream of the bridge to the headwaters.

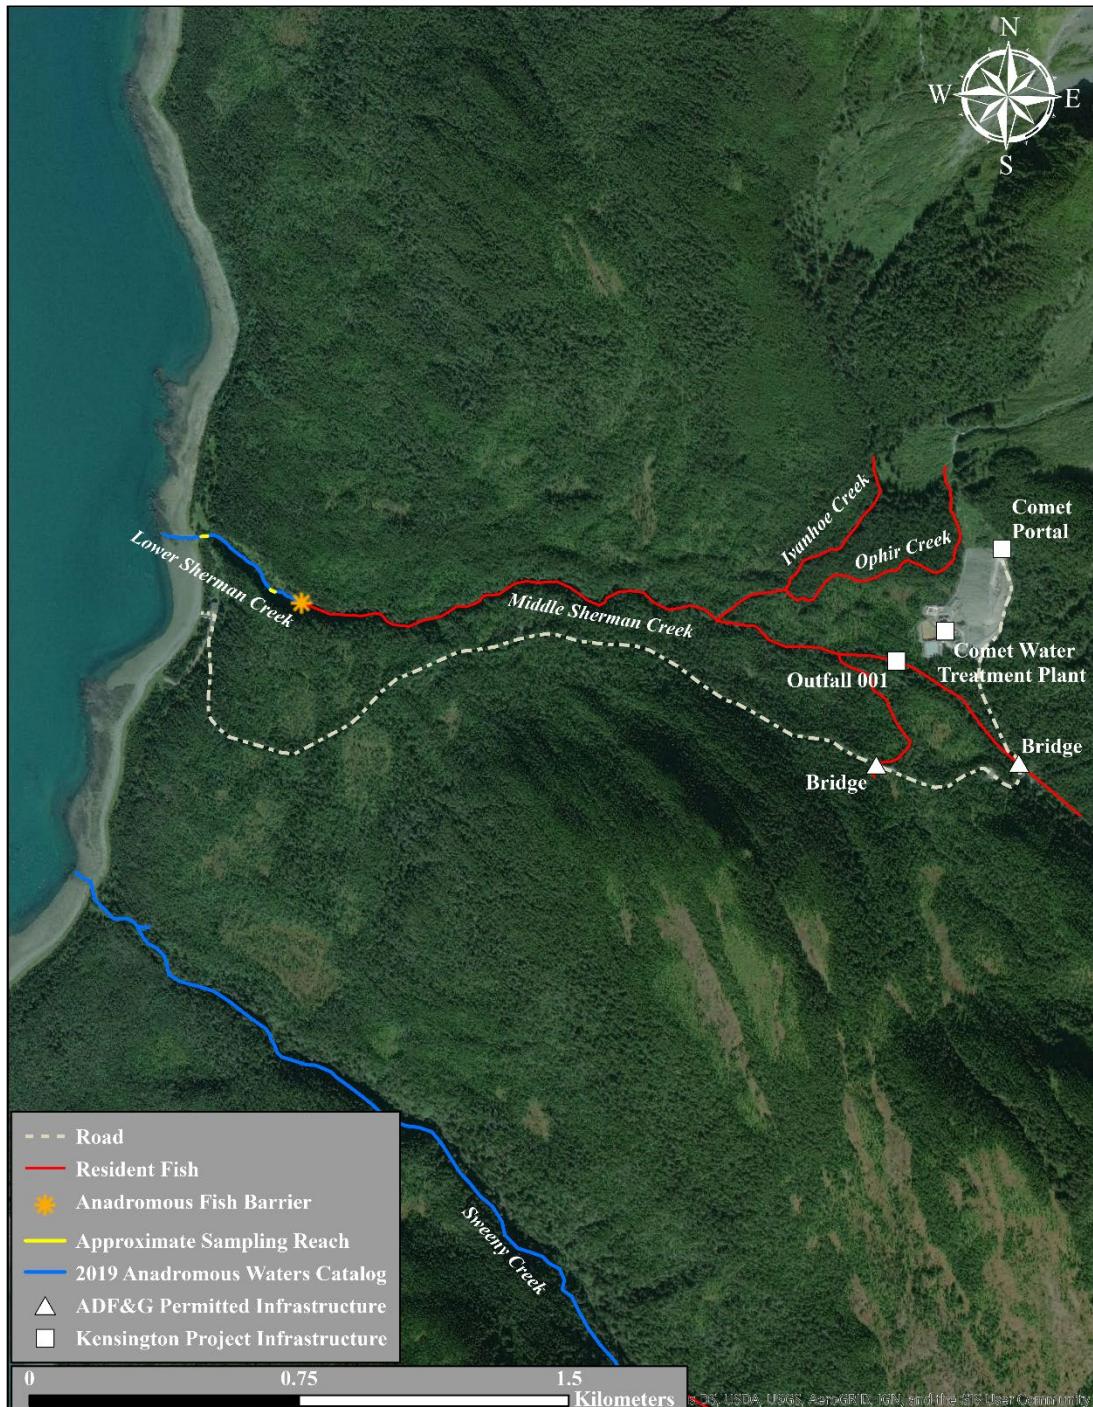

Figure 11.—Sherman Creek map.

### ***Lower Sherman Creek***

Lower Sherman Creek provides spawning habitat for chum and pink salmon (Stream No. 115-31-10330; Johnson and Blossom 2019). We also have documented juvenile Dolly Varden char in the system (Timothy and Kanouse 2012). Lower Sherman Creek is a mixture of drainages near and from mine infrastructure in Middle Sherman Creek<sup>f</sup> and its tributaries. We sample periphyton, BMIs, and sediment in a moderate gradient medium width mixed control channel (Paustian 2010) at Sample Point 1 (SP1; Figure 12), periphyton and BMIs at Sample Point 2 (SP2; Figure 13), a similar channel type. We count adult salmon throughout Lower Sherman Creek to the barrier falls.

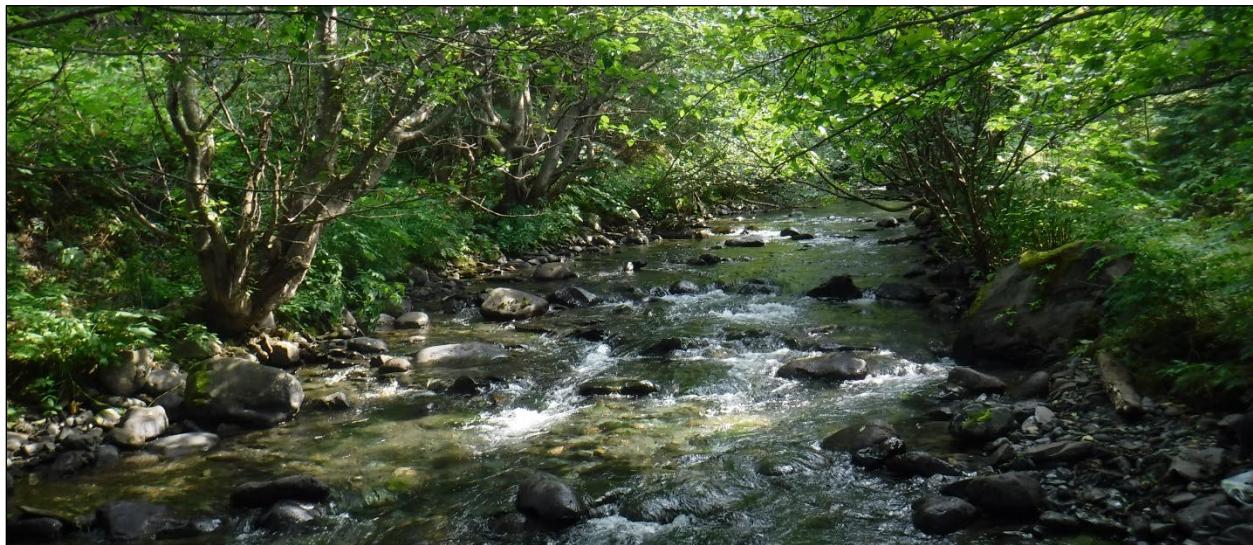

Figure 12.–Lower Sherman Creek at SP1, August 2, 2019.

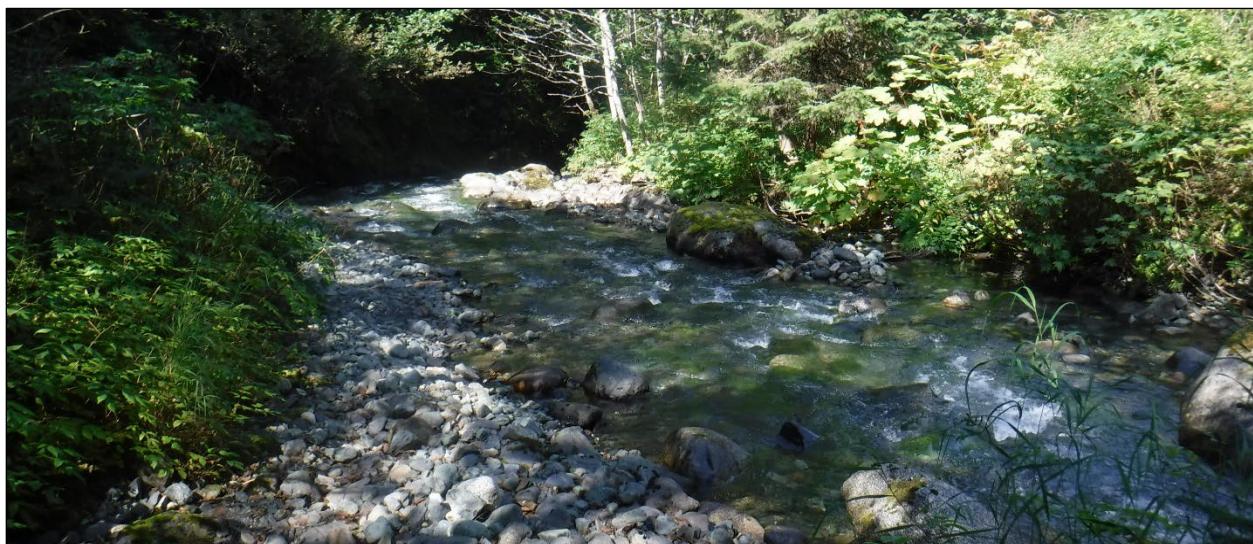

Figure 13.–Lower Sherman Creek at SP2, August 5, 2019.

---

<sup>f</sup> Mine facilities include the Comet water treatment plant, waste rock pile, bridges and culverts; drainages include Ivanhoe Creek, Ophir Creek, South Fork Sherman Creek, and Comet water treatment plant Outfall 001; aquatic studies are not required in Middle or Upper Sherman Creeks.

## SAMPLING SCHEDULE

We collected data between April 30 and October 31 in 2019 (Table 2).

Table 2.—Aquatic studies sampling schedule, 2019.

Aquatic Study	Lower Slate	West Fork Slate	East Fork Slate	Upper Slate	Lower Johnson	Upper Johnson	Lower Sherman
Periphyton	5/1 <sup>a</sup> 8/1	---	4/30 <sup>a</sup> 8/1	---	---	---	---
Benthic macroinvertebrates	5/1	5/1	4/30	4/30	---	5/1	4/30
Adult salmon counts	7/25–10/31	---	---	---	7/25–10/31	---	7/24–9/17
Spawning substrate	7/22, 7/25	---	---	---	---	---	---
Sediment element concentrations	7/22	---	7/22	8/5	7/22	---	7/22

<sup>a</sup> Sampling not required by APDES permit or Plan of Operations.

## SAMPLING LOCATIONS

We recorded coordinates for each sample site (Table 3) and adult salmon count reach markers in Lower Slate Creek, Lower Johnson Creek, and Lower Sherman Creek (Tables 4–6).

## METHODS

We annually review data sets to ensure accuracy and consistency with modifications to methods, and report corrections and updates in the document and appendices. The most recent technical report presents the current data sets and should be used to analyze data from previous years.

### PERIPHYTON: CHLOROPHYLL DENSITY AND COMPOSITION

Periphyton is composed of primary producing organisms such as algae, cyanobacteria, heterotrophic microbes, and detritus, attached to the submerged surfaces of aquatic ecosystems. Algal density and community structure are influenced by water and sediment quality through physical, chemical, and biological factors that change throughout the year (Barbour et al. 1999). The concentration of chlorophyll *a* (Chl-*a*) pigment in periphyton samples provides an estimate of active algal biomass (density), while concentrations of chlorophyll *b* (Chl-*b*) and chlorophyll *c* (Chl-*c*) pigments estimate the composition of algal organisms present, such as green algae that produce Chl-*b*, and diatoms and brown algae that produce Chl-*c*.

#### Requirement APDES 1.5.3.5.2

The APDES permit requires monitoring periphyton chlorophyll density and composition in Lower Slate Creek, East Fork Slate Creek, and Lower Sherman Creek annually between late-June and early-August and not within three weeks following peak discharge to detect changes over time. The APDES permit also requires monitoring at reference sites in West Fork Slate Creek and Upper Slate Creek at the same time to detect variations due to natural factors, such as mineral seeps, climate, and stream flow.

#### Sample Collection and Analysis

We collected 10 smooth, flat, undisturbed, and perennially wetted rocks from submerged cobble in riffle habitats in less than 0.45 m water depth at each sample site and submerged the rocks in the creek with the sample area facing up until sampling. We held a 5 × 5 cm square of high-density foam on the sample area and scrubbed the area around the foam with a toothbrush to remove algae and other organisms outside the sample area, then rinsed the rock by dipping it in the stream while holding the foam in place. We also rinsed the toothbrush in the stream.

We placed a 47 mm diameter Type A/E 1  $\mu\text{m}$  glass fiber filter into a Nalgene® filter holder attached to a vacuum pump with a gauge, then removed the foam square and scrubbed the underside of the foam and the sample area with the toothbrush into the filter holder. We used stream water in a wash bottle to rinse the loosened periphyton from the foam, rock, toothbrush, and the inside of the filter holder onto the filter. We scrubbed the sample area a second time and repeated the rinse cycle. We pumped most of the water through the filter, maintaining pressure less than 34 kPa, and added a few drops<sup>g</sup> of saturated magnesium carbonate solution<sup>h</sup> to the filter before pumping the sample dry. We removed the glass fiber filter, folded it in half with the sample on the inside, and wrapped it in a white coffee filter to absorb additional water. We placed the samples in a sealed, labeled plastic bag with desiccant and stored the samples in a light-proof cooler containing frozen icepacks during transportation, in a camp freezer while onsite, and in a -20°C ADF&G Douglas laboratory freezer until processing.

We followed USEPA (1997) protocol for chlorophyll extraction and measurement, determining instrument and estimated detection limits, and data analysis.<sup>i</sup> We removed the samples from the freezer, cut them into small pieces, and placed the filter pieces for each sample into individual 15 mL screw cap centrifuge tubes containing 10 mL of 90% buffered acetone. We capped the centrifuge tubes and shook each tube vigorously to submerge the filter pieces, placed them in a rack, covered them with aluminum foil, and stored them in a refrigerator overnight to extract the chlorophyll.<sup>j</sup>

The following day, we centrifuged the samples for 20 min at 500 relative centrifugal force, individually decanted the supernatant into a cuvette, and measured each sample absorbance at wavelengths 664 nm, 647 nm, 630 nm, and 750 nm using a Shimadzu UV-1800 spectrophotometer. Prior to measuring samples, we inserted two cuvettes with 90% acetone to correct for the absorbance of the solvent at each wavelength. We treated each sample with 80  $\mu\text{L}$  of 0.1 N hydrochloric acid for 90 seconds to convert the chlorophyll to phaeophytin, and measured absorbance at wavelengths 665 nm and 750 nm.

We used trichromatic equations to estimate Chl-*a*, Chl-*b*, and Chl-*c* concentrations, and corrected for turbidity using the 750 nm absorbance value. We corrected Chl-*a* concentrations when phaeophytin was detected. When Chl-*a* was not detected in a sample, we report the concentration at the spectrophotometer estimated detection limit and do not report values for Chl-*b* or Chl-*c*. The 2019 estimated detection limit for Chl-*a* concentration was 0.10 mg/m<sup>2</sup>.

## Data Presentation

For each site and by year, we present mean Chl-*a*, Chl-*b*, and Chl-*c* densities in a table, Chl-*a* densities in a figure, and mean proportions of Chl-*a*, Chl-*b*, and Chl-*c* in a figure. We also provide the annual data from 2011 through 2019 (Appendix A). Periphyton sampling during April is not required by the APDES permit or Plan of Operations.

---

<sup>g</sup> This measurement is not exact as the amount of water and MgCO<sub>3</sub> used to create a saturated solution varies and does not affect sample integrity. We used supernatant solution to avoid MgCO<sub>3</sub> solids.

<sup>h</sup> To prevent acidification and conversion of chlorophyll to phaeophytin.

<sup>i</sup> Except we stored the samples longer than 3.5 weeks, and we cut the sample filters, rather than homogenize them, to reduce acetone exposure for laboratory staff.

<sup>j</sup> We allowed samples to saturate for at least 12 h and not more than 24 h.

## BENTHIC MACROINVERTEBRATE DENSITY AND COMMUNITY COMPOSITION

Benthic macroinvertebrates (BMI) classified in the orders Ephemeroptera (mayflies), Plecoptera (stoneflies), and Trichoptera (caddisflies), collectively known as EPT taxa, have complex and short life cycles and many genera are sensitive to changes in water and sediment quality (Barbour et al. 1999). These organisms are secondary producers, feed on periphyton and other macroinvertebrates, and are a food source for fish.

### Requirement APDES 1.5.3.2

The APDES permit requires monitoring BMI density and community composition in Lower Slate Creek, East Fork Slate Creek, Upper Johnson Creek, and Lower Sherman Creek annually between late-March and late-May after spring breakup and before peak snowmelt to detect changes over time. The APDES permit also requires monitoring at reference sites in West Fork Slate Creek and Upper Slate Creek at the same time to detect variations due to natural factors.

### Sample Collection and Analysis

We opportunistically collected 6 BMI samples from each site using a Surber stream bottom sampler in riffles and runs with gravel substrate and different flow velocities: habitats that support greater BMI densities and taxonomic richness (Barbour et al. 1999). We do not sample other habitat types (e.g. pools) to reduce variability of the data.

The Surber stream bottom sampler has a  $0.093\text{ m}^2$  sample area and material is captured in a 200 mL cod end, both constructed with 300  $\mu\text{m}$  mesh net. After securing the frame on the substrate, we scrubbed rocks within the sample area with a brush and disturbed gravels, sand, and silt to about 10 cm depth to dislodge macroinvertebrates into the net. We rinsed the net in the stream to ensure all organisms floated into the cod end, transferred each sample from the cod end to a labeled 500 mL plastic bottle, and preserved the samples in 95% ethanol at a ratio of three parts ethanol to one part sample. We discarded samples when sediment overfilled the cod end.

Contractor Matt Kern of Alder Grove Farm used an elutriator system and 0.5 mm and 0.3 mm sieves to sort macroinvertebrates from debris,<sup>k,l</sup> and identified organisms to the lowest practical taxonomic level<sup>m</sup> using Merritt and Cummins (1996) and Stewart and Oswood (2006). Habitat biologists provided quality control by verifying macroinvertebrate identification of 5 samples.

We calculated BMI density ( $\text{per m}^2$ ) for each sample by dividing the number of macroinvertebrates by  $0.093\text{ m}^2$ : the Surber sampling area. We estimated mean BMI density for each site by calculating the mean density among the 6 samples. We report taxa richness as the number of

Unpublished document can be obtained from the Southeast Regional Supervisor, ADF&G Division of Habitat, 802 3<sup>rd</sup> Street, Douglas, AK.

<sup>m</sup> Insects of the orders Ephemeroptera, Plecoptera, Trichoptera, and Diptera to genus, except nonbiting midges to family Chironomidae, and all others to class or order.

taxonomic groups identified to the lowest practical level and exclude terrestrial<sup>n</sup> organisms from all calculations.

Shannon Diversity ( $H$ ) and Evenness ( $E$ ) Indices provide measures of taxonomic diversity and abundance equality. We calculate these indices using the following equations given in Magurran (1988):

$$H = - \sum_{i=1}^S (P_i \log_{10} P_i)$$

and

$$E = \frac{H}{\log_{10} S},$$

where  $P_i$  is the number of macroinvertebrates per taxonomic group divided by the total number of macroinvertebrates in the sample, and  $S$  is the number of taxonomic groups in the sample.<sup>o</sup> A single taxa macroinvertebrate community has an  $H$  value of 0, which increases with the number of taxa (richness) and abundance equality (evenness). The Evenness calculation normalizes the  $H$  value to a number between 0 and 1, with an  $E$  value of 1 indicating all taxa are equally abundant.

## Data Presentation

For each site and by year, we present a table summarizing mean BMI density, total taxa, total EPT taxa, percent EPT, and mean Shannon Diversity and Evenness scores, and illustrate mean densities in a figure. Data summaries from 2011 through 2019 also are presented (Appendix B).

## ADULT SALMON COUNTS

### Requirement Plan of Operations

The Plan of Operations (Coeur 2005) requires weekly surveys of adult chum, coho, and pink salmon in Lower Slate Creek, Lower Johnson Creek, and Lower Sherman Creek throughout the spawning season.

### Sample Collection

We surveyed Slate Creek, Johnson Creek, and Sherman Creek downstream of fish migration barriers once per week between mid-July and late-August and counted the number of adult pink salmon, chum salmon, and carcasses. We surveyed Slate and Sherman Creeks by foot and Johnson Creek by helicopter, using polarized glasses as necessary to improve visibility. We also surveyed Slate and Johnson Creeks by foot once per week from late-September through October to count the number of adult coho salmon and carcasses. To improve coho salmon observations, we recorded underwater videos with a GoPro in large pools and around large woody debris, habitats where adult coho salmon tend to concentrate.

---

<sup>n</sup> Including adult terrestrial insects of the orders Ephemeroptera, Plecoptera, Trichoptera, and Diptera.

<sup>o</sup> Assuming all taxonomic groups are represented.

We began each survey at the stream mouth, moving upstream by section and ending at the fish migration barrier. Slate Creek is sectioned in 100 m reaches, Johnson Creek by landmarks, and Sherman Creek in 50 m reaches. For Johnson Creek aerial surveys, a team of two biologists independently recorded the number of live fish and carcasses by species in each section and we used the average of the two biologists' counts to estimate the total number of fish by species for each reach and survey, and rounded down all decimal numerals to integers in the calculations. For Slate and Sherman Creeks, one biologist recorded quantity by species while the other biologist verified counts and provided bear protection. We also recorded approximate weather and flow conditions during each survey.

## Data Presentation

For each site, we present figures of the weekly adult pink salmon count and distribution and provide the 2011–2019 counts by species in a table. We have also compiled the 2019 data and 2011–2019 pink salmon counts by statistical week and reach (Appendix C).

## SPAWNING SUBSTRATE COMPOSITION

### Requirement APDES 1.5.3.5.1

The APDES permit requires annually sampling pink salmon spawning substrate during early-July at Lower Slate Creek SP1 and SP2 to detect change in composition over time. We calculate the geometric mean particle size, an index of substrate textural composition, for each sample and among samples collected at each site each year.

### Sample Collection

We collected four sediment samples at two locations in Lower Slate Creek using a McNeil sampler, which has a 15 cm basal core diameter and 25 cm core depth. We selected sample sites with substrate measuring less than 10 cm, the maximum gravel size used by pink salmon (Lotspeich and Everest 1981, Kondolf and Wolman 1993), and where the stream gradient was less than 3%<sup>p</sup>. We pushed the McNeil sampler into the substrate until the sample core was buried, then transferred the sediments to a bucket. We wet-sieved samples onsite using sieve sizes 101.6, 50.8, 25.4, 12.7, 6.35, 1.68, 0.42, and 0.15 mm and measured the contents of each sieve to the nearest 25 mL by the volume of water displaced in 600 mL and 1 L plastic beakers.<sup>q</sup> We transferred the fines that passed through the 0.15 mm sieve to Imhoff cones, allowed 10 min settling time, and measured the sediment volume to the nearest 1 mL using the Imhoff cone gradations.

<sup>p</sup> Valentine, B. E. 2001. Unpublished. Stream substrate quality for salmonids: Guidelines for Sampling, Processing, and Analysis. California Department of Forestry and Fire Protection, Coast Cascade Regional Office, Santa Rosa, CA.

<sup>q</sup> Except we measure the contents of the 0.15 mm sieve to the nearest 1 mL using an Imhoff cone.

For the fines that pass through the 0.15 mm sieve, we converted sediment wet weights to dry weights using standards identified by Zollinger (1981). For all other sediments, we converted wet weights to dry weights using a correction factor derived from Shirazi et al. (1981), assuming a gravel density of 2.6 g/cm<sup>3</sup> (Aquatic Science Inc. 2011). We calculated the geometric mean particle size ( $d_g$ ) using methods developed by Lotspeich and Everest (1981), where the midpoint diameter of particles retained in each sieve ( $d$ ) are raised to a power equal to the decimal fraction of volume retained by that sieve ( $w$ ), and multiplied the products of each sieve size to obtain the final product,

$$d_g = d_1^{w1} \times d_2^{w2} \times d_3^{w3} \dots d_n^{wn}$$

## Data Presentation

We present a table of the geometric mean particle sizes (GMPS) for the 2011–2019 data at each site. The annual data from 2011 through 2019 also are presented (Appendix D).

## SEDIMENT COMPOSITION AND ELEMENT CONCENTRATIONS

### Requirement APDES 1.5.2

Sediment element concentrations are influenced by a variety of factors, such as geochemical composition and weathering within the watershed, sediment grain size, organic content, and development (Tchounwou et al. 2012). Subsequently, sediment element concentrations influence benthic aquatic productivity, and heavy metals in sediments can decrease BMI taxa richness and change the composition of BMI communities (Qu et al. 2010).

The APDES permit requires annually sampling fine sediments in Lower Slate Creek, East Fork Slate Creek, Upper Slate Creek, Lower Johnson Creek, and Lower Sherman Creek for particle size, total solids, total volatile solids, total sulfide, total organic carbon, and total concentrations of silver (Ag), aluminum (Al), arsenic (As) cadmium (Cd), chromium (Cr), copper (Cu), mercury (Hg), nickel (Ni), lead (Pb), selenium (Se), and zinc (Zn).

### Sample Collection and Analysis

Wearing latex gloves, we opportunistically collected submerged sand and silt at each site within actively flowing channels and retained the top 4 cm of sediment in three glass jars provided by the laboratory.<sup>r</sup> We stored the samples in a cooler with frozen icepacks during transport and in an ADF&G Douglas laboratory fridge until we shipped them to the ALS Environmental laboratory in Kelso, WA for analyses.

We shipped the samples in a cooler with frozen icepacks via overnight air freight and maintained written chain of custody documentation. ALS Environmental measured particle size, total solids, total volatile solids, total sulfide, total organic carbon, and total concentrations of Ag, Al, As, Cd, Cr, Cu, Hg, Ni, Pb, Se, and Zn on a dry-weight basis (Table 7).<sup>s</sup> The laboratory provided Tier II quality assurance and quality control information, including results for matrix spikes, sample blanks, and sample duplicates.

---

<sup>r</sup> In 2015, we discontinued sieving sediments during collection to avoid washing contaminants from the sample.

<sup>s</sup> The AECOM Environmental Toxicology lab in Fort Collins, CO completed the 2011–2013 sediment sample analyses, and the ALS Environmental lab in Kelso, WA has completed the sediment sample analyses since 2014.

Table 7.—Sediment tests, analytes, and methods.

Test Description	Analyte	Method
Standard test method for particle-size analysis of soils	Particle size determination	ASTM D422
Puget Sound Estuary Program sediment total organic carbon	Total organic carbon	PSEP TOC
Total solids on liquids, modified for solids	Total solids	160.3 Modified
Puget Sound Estuary Program sediment sulfide	Total sulfide	PSEP Sulfide
Total volatile solids, modified for solids	Total volatile solids	160.4 Modified
Mercury in solid or semisolid waste	Hg	7471B
Determination of trace elements in waters and wastes by ICP/MS	Ag, Al, As, Cd, Cr, Cu, Ni, Pb, Se, Zn	200.8

## Data Presentation

We present two figures for each site: the 2019 sample concentrations and results by analyte for the 2011–2019 data. We report mean values when sample duplicate data are available and we illustrate sediment element concentrations undetected as an empty circle (○) at the method reporting limit and measured element concentrations as a solid circle (●).

We compare the data with the threshold effects concentrations (TEC) and the probable effects concentrations (PEC) for inorganics in freshwater sediment guidelines developed by the National Oceanic and Atmospheric Administration (Buchman 2008). The guidelines are based on results of controlled laboratory bioassays, wherein element concentrations below the TEC are not expected to adversely affect aquatic life survival and growth, and element concentrations above the PEC are expected to adversely affect aquatic life survival and growth more often than not (MacDonald et al. 2000).

We also provide the 2011–2019 sediment composition and element concentration data by site and the 2019 laboratory report (Appendix E).

## RESULTS

### SLATE CREEK

#### Lower Slate Creek

##### *Periphyton: Chlorophyll Density and Composition*

The 2019 Lower Slate Creek mean chlorophyll *a* and *c* densities were 33.71 mg/m<sup>2</sup> and 6.49 mg/m<sup>2</sup>, respectively: both greater than the mean densities observed since 2011 (Table 8; Figure 14) and mean densities observed at other sampling sites near the project. The mean proportion of chlorophylls *a*, *b*, and *c* was similar to previous years (Figure 15).

Table 8.–Lower Slate Creek mean chlorophylls *a*, *b*, and *c* densities, 2011–2019.

	07/29/11	07/25/12	07/31/13	07/30/14	07/28/15	07/26/16	07/24/17	08/07/18	08/01/19
Chl- <i>a</i> (mg/m <sup>2</sup> )	5.15	2.31	12.59	3.97	2.16	5.26	2.30	4.21	33.71

Note: Minimum, mean, and maximum values.

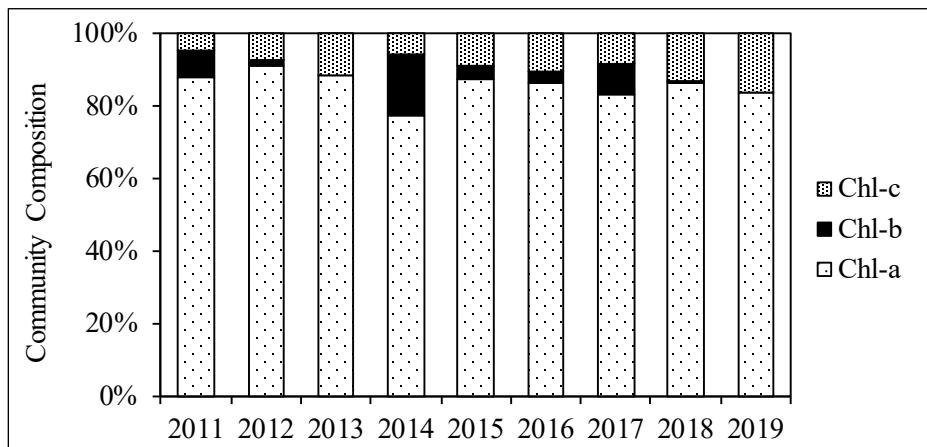

Figure 15.–Lower Slate Creek mean proportions of chlorophylls *a*, *b*, and *c*, 2011–2019.

### Benthic Macroinvertebrate Density and Community Composition

Among the 2019 Lower Slate Creek BMI samples, we identified 18 taxa and estimate mean density at 934 BMI/m<sup>2</sup>, of which 57% were EPT insects (Table 9; Figure 16). Mean BMI density and taxa richness were among the lowest observed since 2011, similar to the 2018 results. The Shannon Diversity and Evenness scores were within ranges observed 2011–2018. The dominant taxa were Diptera: Chironomidae (nonbiting midges) and Ephemeroptera: *Baetis*, composing 29% and 18% of the samples.

Table 9.—Lower Slate Creek BMI data summaries, 2011–2019.

	05/04/11	05/02/12	04/30/13	04/30/14	04/27/15	04/26/16	04/25/17	05/03/18	05/01/19
Mean BMI density (per m <sup>2</sup> )	2,057	3,154	2,581	4,136	3,407	3,394	1,308	482	934

Chum salmon	59	1	1	0	13	45	1	0	0
Coho salmon	0	0	26	5	0	2	5	1	1

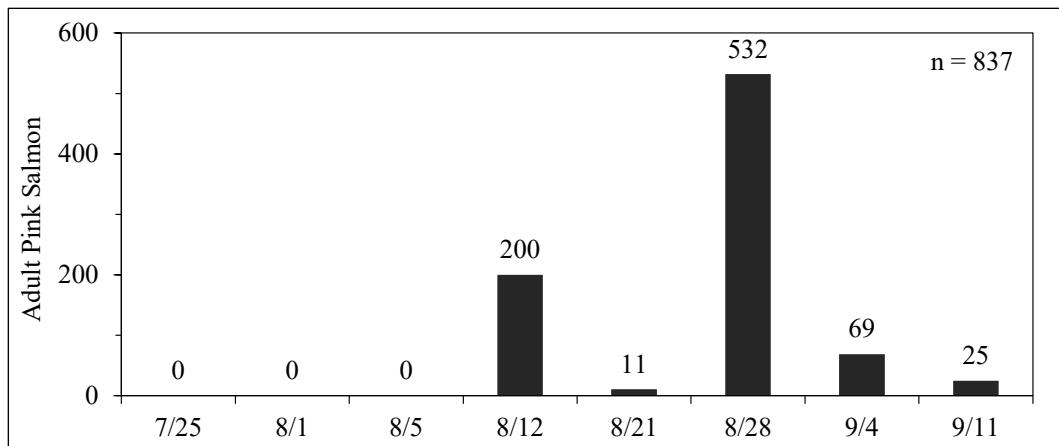

Figure 17.—Lower Slate Creek weekly adult pink salmon counts, 2019.

### ***Spawning Substrate Composition***

#### **Sample Points 1 and 2**

The 2019 Lower Slate Creek GMPS was 14.8 mm at SP1 and 23.1 mm at SP2 (Table 11). The SP1 GMPS was similar to the 2017–2018 results, and the SP2 GMPS was larger than previously observed.

### ***Sediment Element Concentrations***

In the 2019 Lower Slate Creek sediment sample, the Al and Cr concentrations were less than the ranges observed 2011–2018 and the remaining element concentrations were within the ranges previously observed (Figures 18, 19). The As, Cu, Ni, and Zn values remain above the TEC freshwater sediment toxicity guidelines.

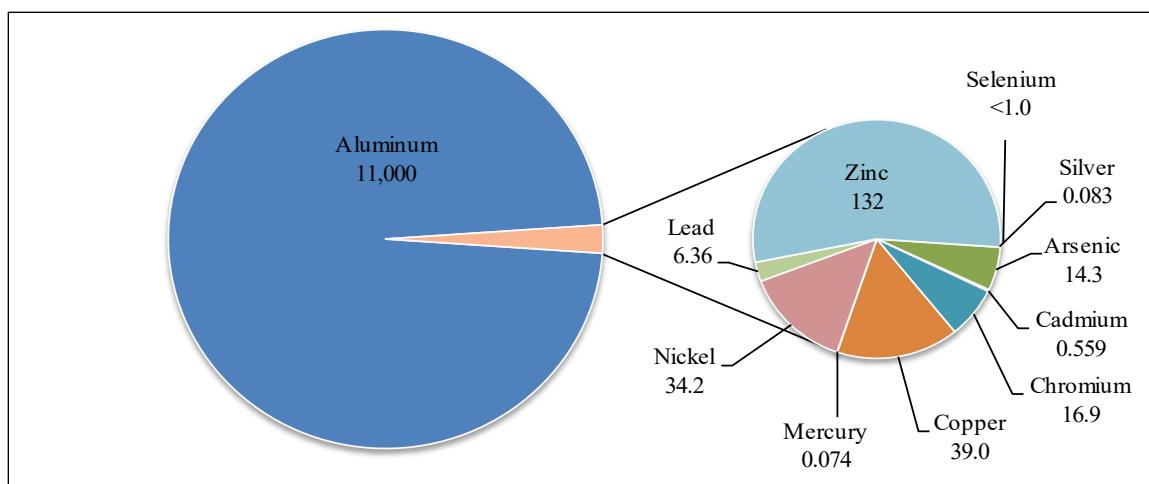

Figure 18.—Lower Slate Creek sediment element concentrations (mg/kg), 2019.

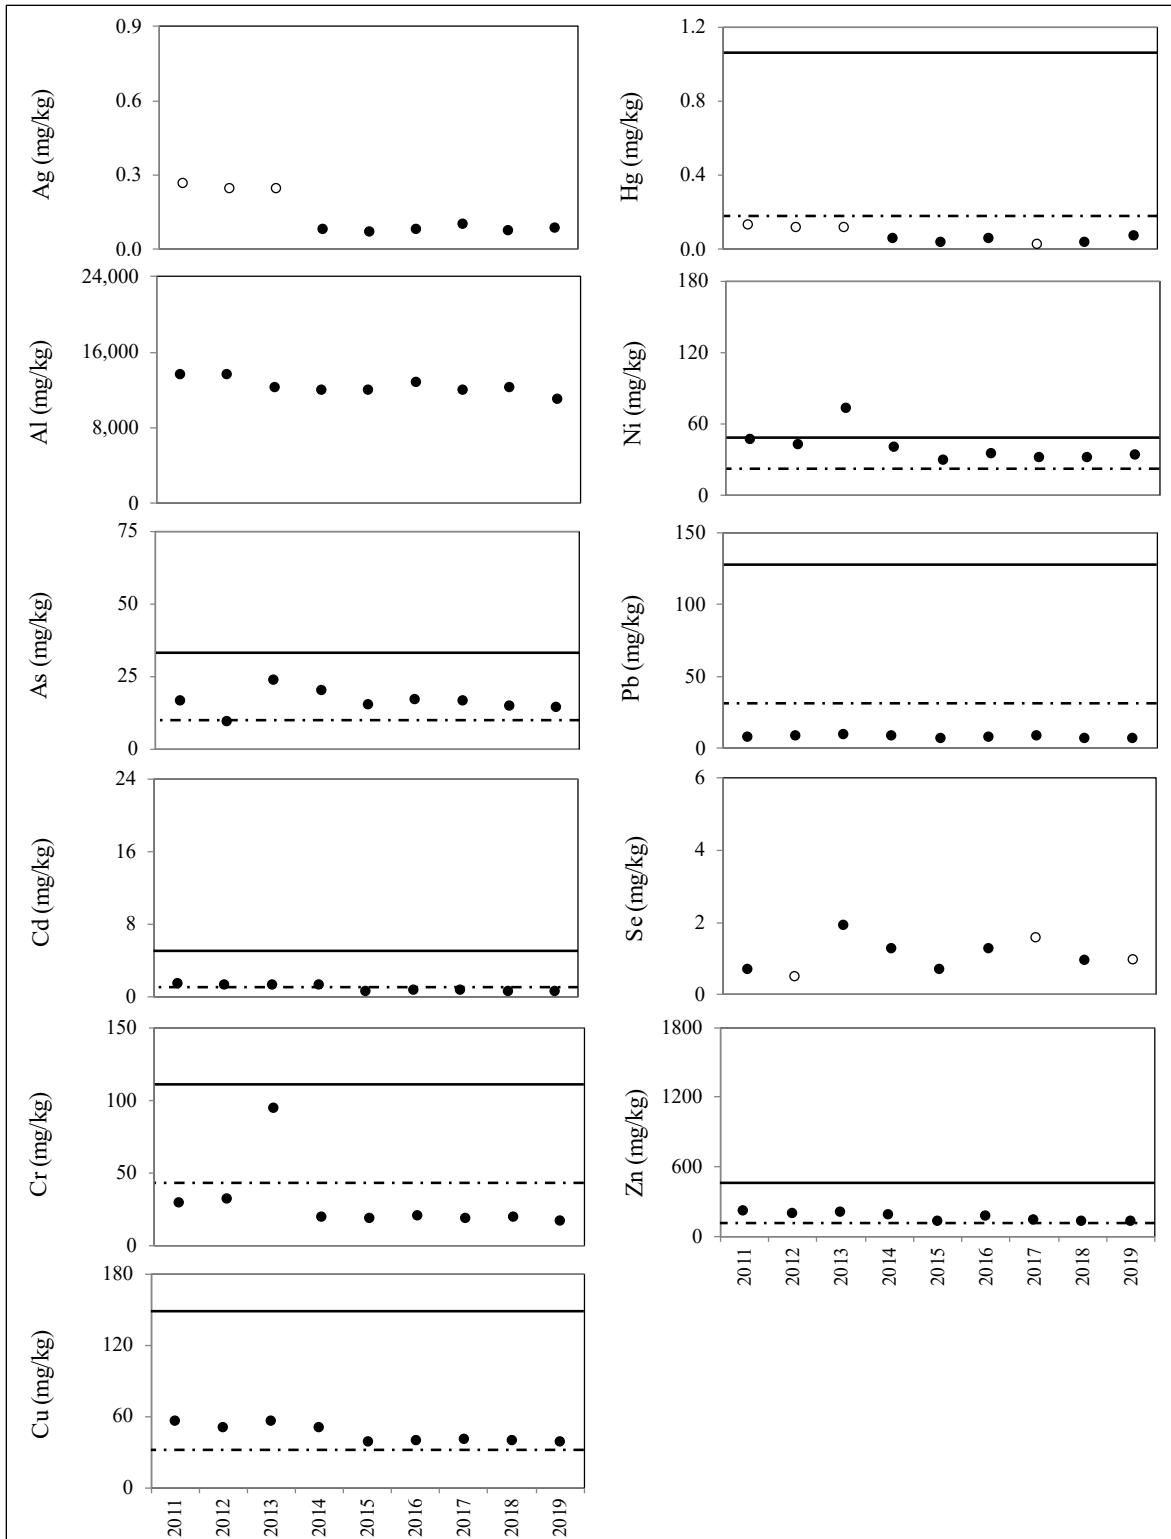

Figure 19.—Lower Slate Creek sediment element concentrations, 2011–2019.

Note: Elements undetected (o) are presented at the method reporting limit. The dashed line represents TEC and solid line represents the PEC; guidelines are not published for Ag, Al, or Se (Buchman 2008).

## West Fork Slate Creek

### *Periphyton: Chlorophyll Density and Composition*

The 2019 West Fork Slate Creek mean chlorophyll *a* density was 2.95 mg/m<sup>2</sup>, within the range observed since 2011 (Table 12; Figure 20). The mean proportion of chlorophylls *a*, *b*, and *c* was similar to previous years (Figure 21).

Table 12.—West Fork Slate Creek mean chlorophylls *a*, *b*, and *c* densities, 2011–2019.

### Benthic Macroinvertebrate Density and Community Composition

Among the 2019 West Fork Slate Creek BMI samples, we identified 16 taxa and estimate mean density at 1,299 BMI/m<sup>2</sup>, of which 91% were EPT insects (Table 13; Figure 22). BMI taxa richness was the lowest observed since 2011 and the Shannon Diversity and Evenness scores were among the lowest observed. The dominant taxon was Ephemeroptera: *Baetis*, composing 54% of the samples.

Table 13.—West Fork Slate Creek BMI data summaries, 2011–2019.

	05/04/11	05/02/12	04/30/13	04/30/14	04/27/15	04/26/16	04/25/17	05/03/18	05/01/19

## East Fork Slate Creek

### *Periphyton: Chlorophyll Density and Composition*

The 2019 East Fork Slate Creek mean chlorophyll *a* density was 3.51 mg/m<sup>2</sup>, within the range observed since 2011 (Table 14; Figure 23). The mean proportion of chlorophylls *a*, *b*, and *c* was similar to previous years (Figure 24).

Table 14.—East Fork Slate Creek mean chlorophylls *a*, *b*, and *c* densities, 2011–2019.

Note: Minimum, mean, and maximum values.

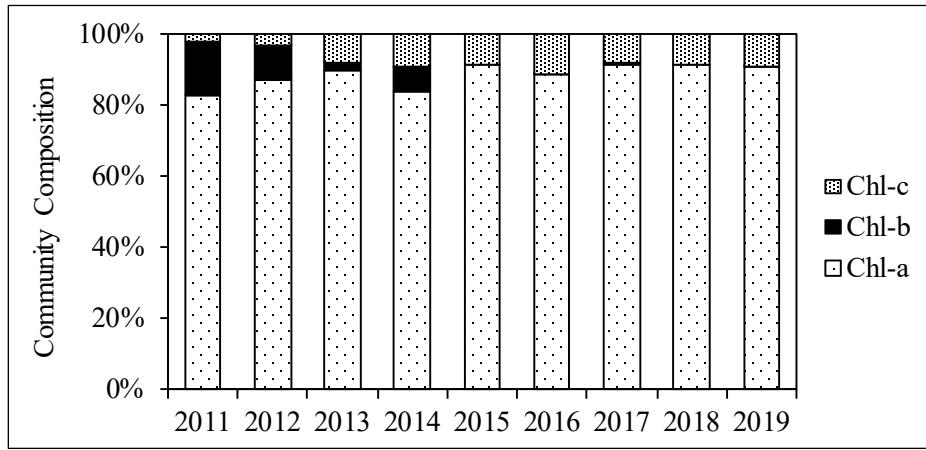

Figure 24.—East Fork Slate Creek mean proportions of chlorophylls *a*, *b*, and *c*, 2011–2019.

### Benthic Macroinvertebrate Density and Community Composition

Among the 2019 East Fork Slate Creek BMI samples, we identified 25 taxa and estimate mean density at 3,866 BMI/m<sup>2</sup>, of which 18% were EPT insects, all within ranges observed 2011–2018 (Table 15; Figure 25). The Shannon Diversity and Evenness scores were consistent with most previous years, and the dominant taxon was Bivalvia: *Pisidium* (pea clams), composing 56% of the samples.

Table 15.—East Fork Slate Creek BMI data summaries, 2011–2019.

	05/12/11	04/27/12	04/29/13	04/30/14	04/29/15	04/25/16	04/27/17	05/03/18	04/30/19

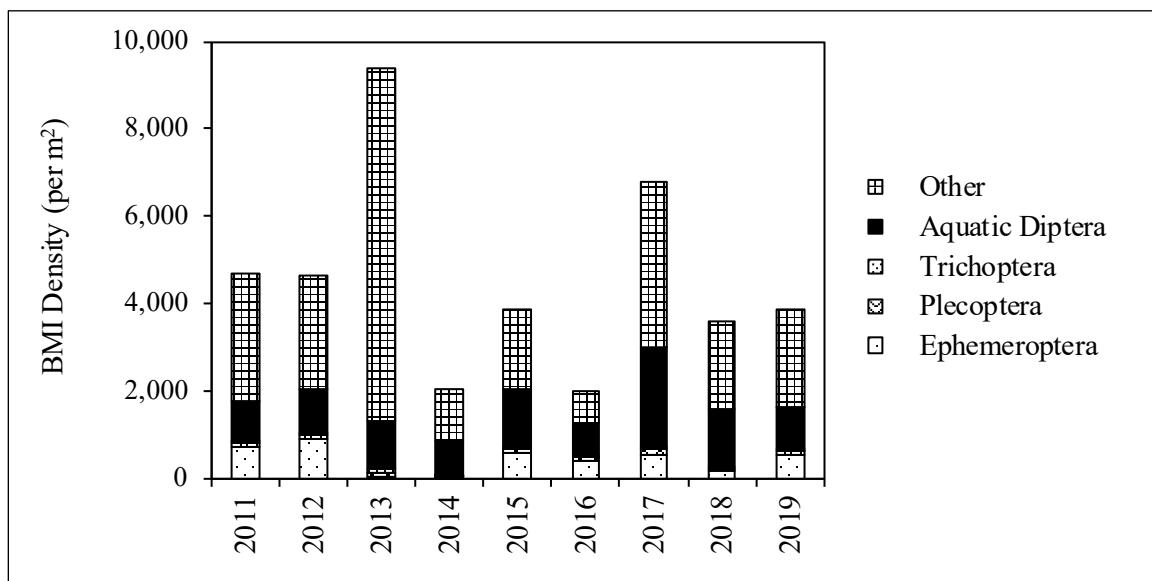

Figure 25.—East Fork Slate Creek mean BMI densities and community compositions, 2011–2019.

### ***Sediment Element Concentrations***

The 2019 East Fork Slate Creek sediment sample contained element concentrations within the ranges observed 2011–2018 (Figures 26, 27). The As, Cd, Ni, and Zn concentrations remain above the PEC and the Cu concentration remains above the TEC freshwater sediment toxicity guidelines.

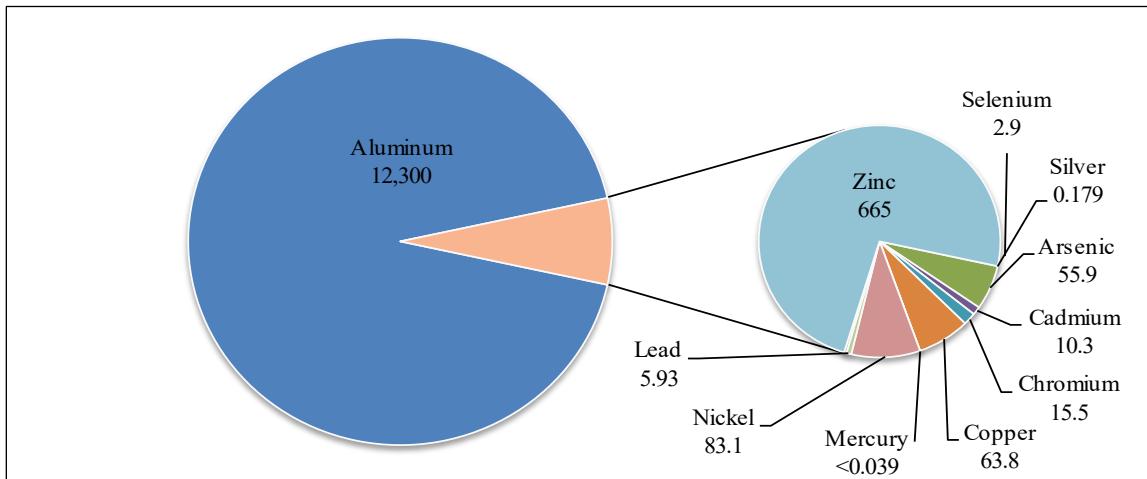

Figure 26.–East Fork Slate Creek sediment element concentrations (mg/kg), 2019.

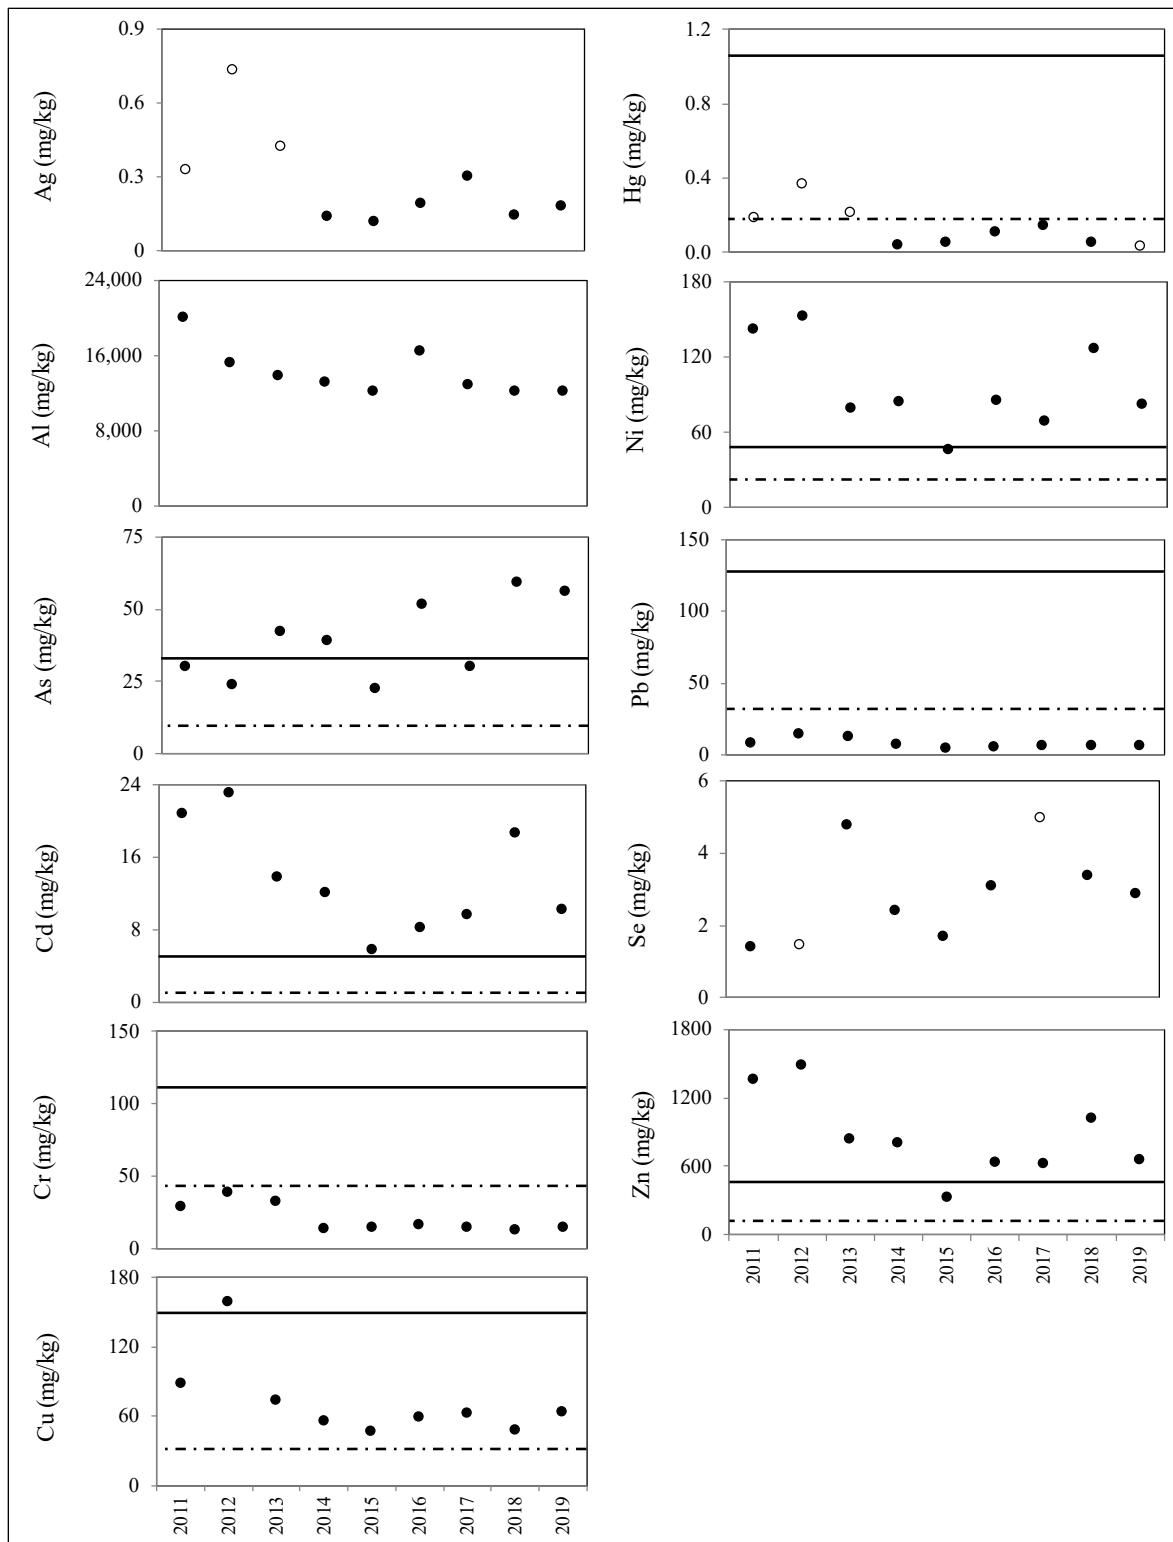

Figure 27.—East Fork Slate Creek sediment element concentrations, 2011–2019.

Note: Elements undetected (o) are presented at the method reporting limit. The dashed line represents TEC and solid line represents the PEC; guidelines are not published for Ag, Al, or Se (Buchman 2008).

## Upper Slate Creek

### *Periphyton: Chlorophyll Density and Composition*

The 2019 Upper Slate Creek mean chlorophyll *a* density was 7.47 mg/m<sup>2</sup>, above the range observed since 2011 (Table 16; Figure 28). The mean proportion of chlorophylls *a*, *b*, and *c* was similar to previous years (Figure 29).

Table 16.—Upper Slate Creek mean chlorophylls *a*, *b*, and *c* densities, 2011–2019.

Note: Minimum, mean, and maximum values.

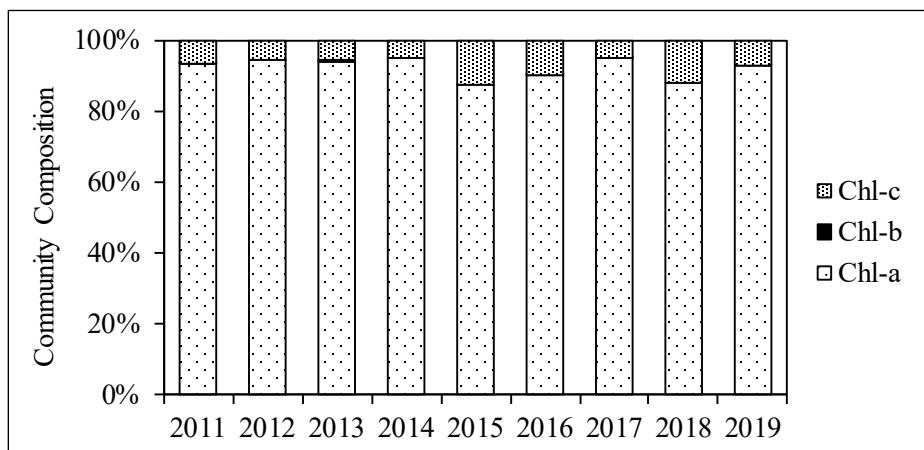

Figure 29.—Upper Slate Creek mean proportions of chlorophylls *a*, *b*, and *c*, 2011–2019.

### Benthic Macroinvertebrate Density and Community Composition

Among the 2019 Upper Slate Creek BMI samples, we identified 24 taxa and estimate mean density at 1,634 BMI/m<sup>2</sup>, of which 83% were EPT insects (Table 17; Figure 30). Mean BMI density was among the lowest observed since 2011 and EPT insects composed a larger proportion of samples than previous years. The Shannon Diversity and Evenness scores were consistent with previous years. The dominant taxa were Ephemeroptera: *Baetis* and *Cinygmulia*, composing 29% and 12% of the samples.

Table 17.—Upper Slate Creek BMI data summaries, 2011–2019.

	05/12/11	04/27/12	04/29/13	04/28/14	04/29/15	04/25/16	04/27/17	05/02/18	04/30/19

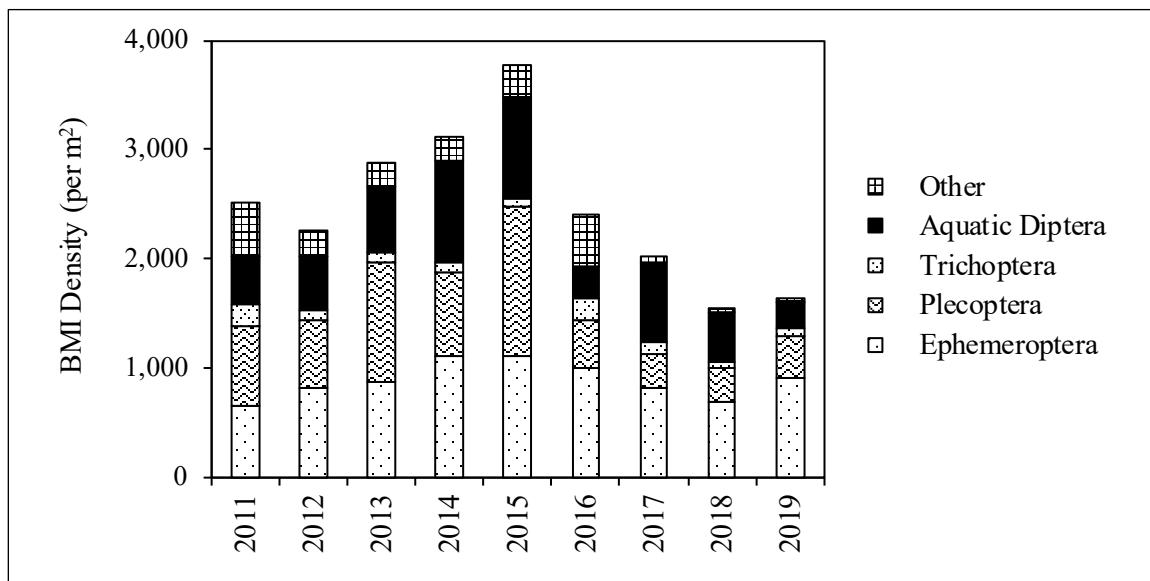

Figure 30.—Upper Slate Creek mean BMI densities and community compositions, 2011–2019.

### ***Sediment Element Concentrations***

The 2019 Upper Slate Creek sediment sample contained element concentrations generally within the ranges observed 2011–2018 (Figures 31, 32). The As, Cr, and Cu concentrations remain above the TEC and the Ni concentration remains above the PEC freshwater sediment toxicity guidelines.

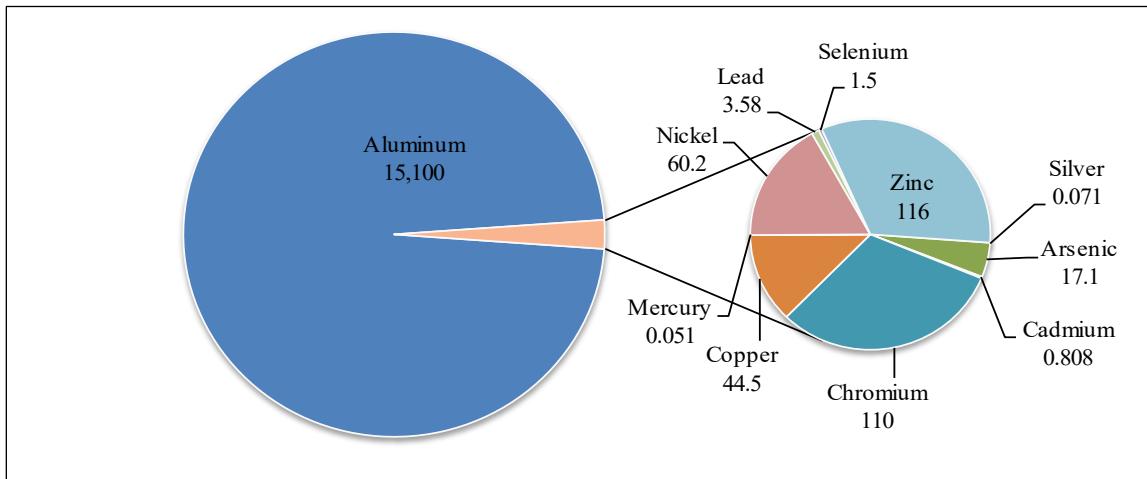

Figure 31.—Upper Slate Creek sediment element concentrations (mg/kg), 2019.

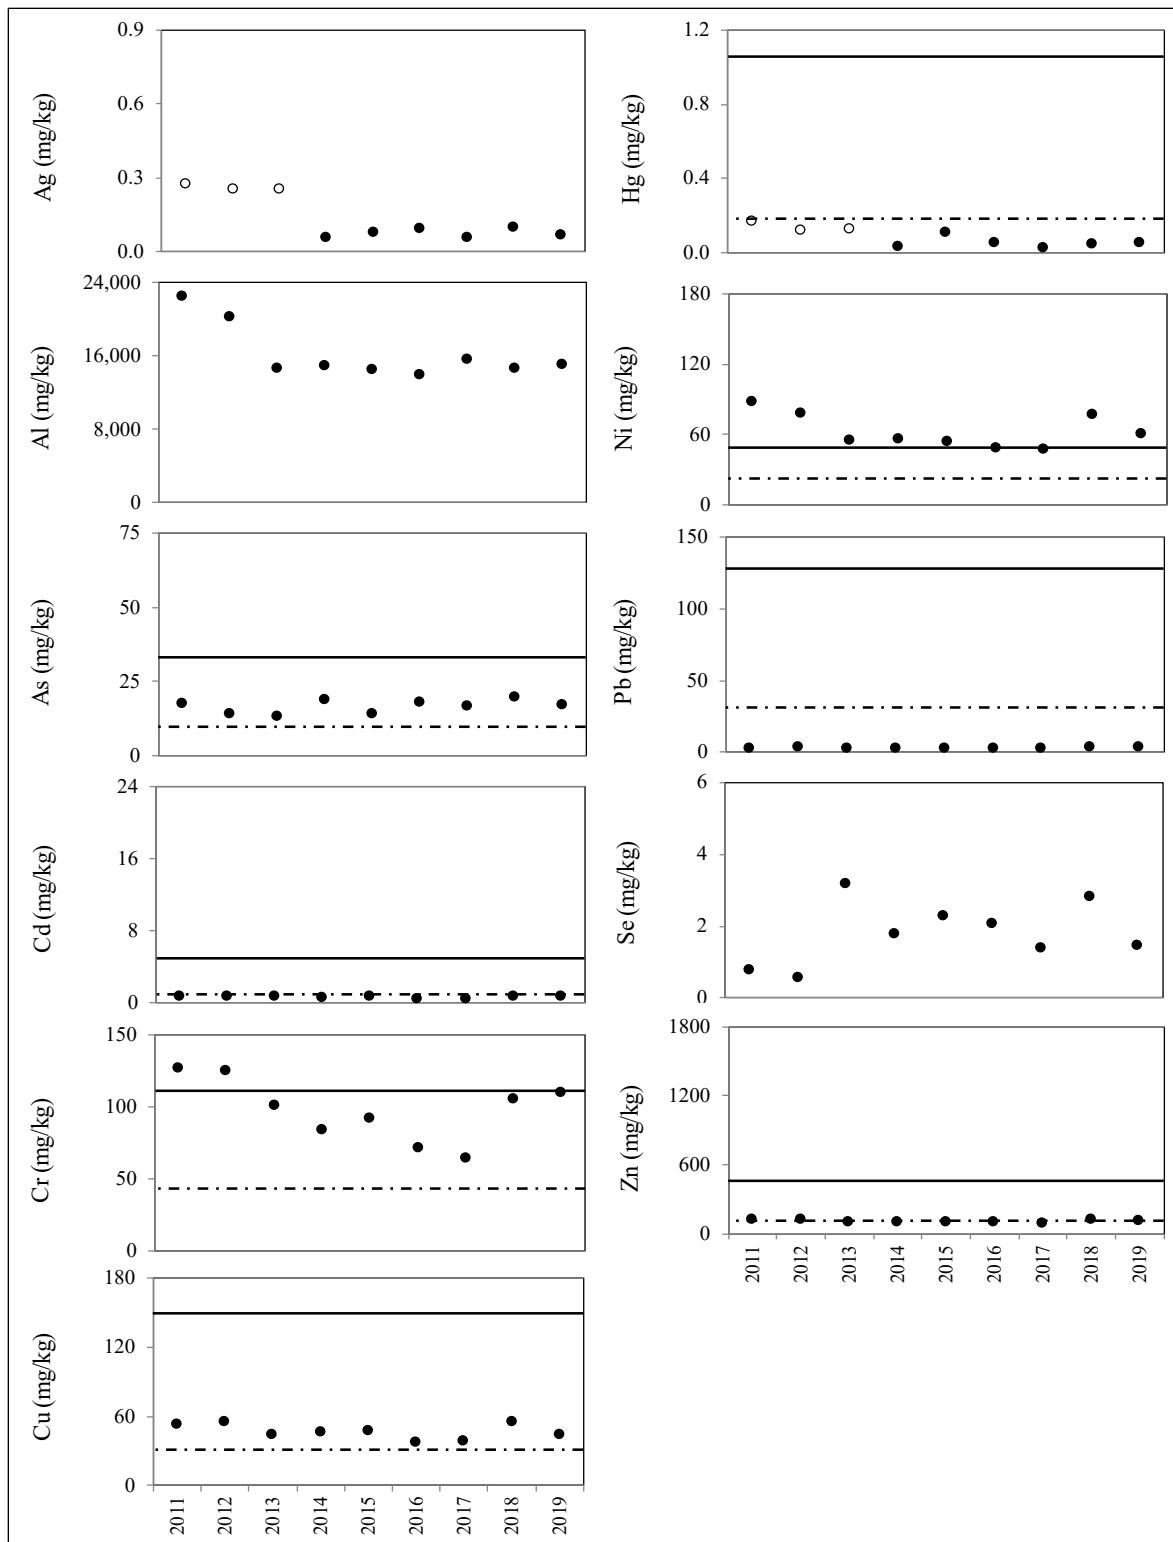

Figure 32.—Upper Slate Creek sediment element concentrations, 2011–2019.

Note: Elements undetected (o) are presented at the method reporting limit. The dashed line represents TEC and solid line represents the PEC; guidelines are not published for Ag, Al, or Se (Buchman 2008).

## JOHNSON CREEK

### Lower Johnson Creek

#### *Adult Salmon Counts*

We counted 4,996 pink salmon, 334 chum salmon, and 94 coho salmon in Lower Johnson Creek during 2019 (Table 18; Figure 33). We did not survey coho salmon during the fourth week of October due to high water and poor visibility.

Table 18.—Lower Johnson Creek adult salmon counts, 2011–2019.

	2011	2012	2013	2014	2015	2016	2017	2018	2019
Pink salmon	17,499	5,016	8,186	189	51,325	428	23,239	434	4,996

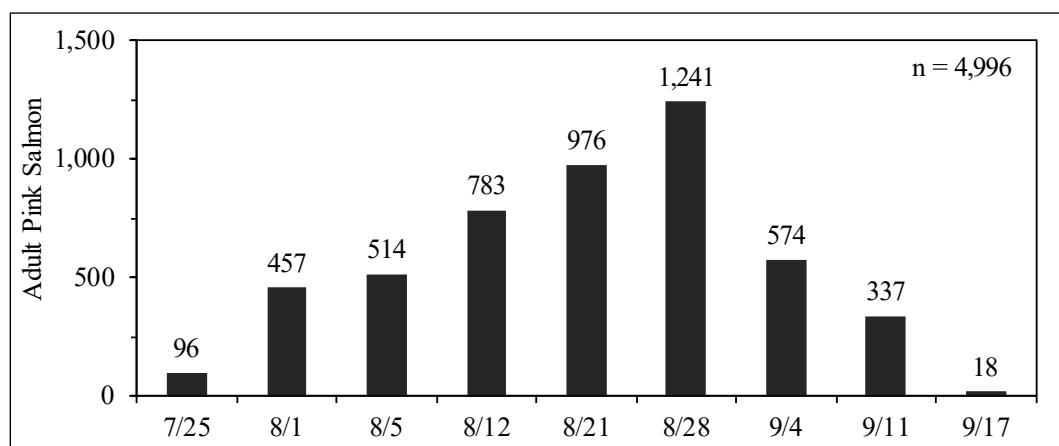

Figure 33.—Lower Johnson Creek weekly pink salmon count, 2019.

#### *Sediment Element Concentrations*

The 2019 Lower Johnson Creek sediment sample contained element concentrations within the ranges observed 2011–2018 (Figures 34, 35). The As and Cu concentrations remain above the TEC freshwater sediment toxicity guidelines.

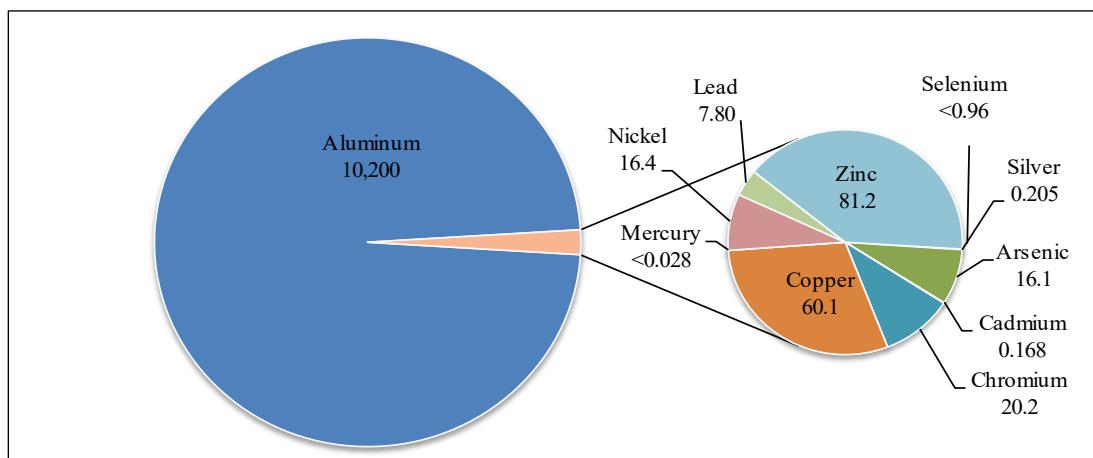

Figure 34.—Lower Johnson Creek sediment element concentrations (mg/kg), 2019.

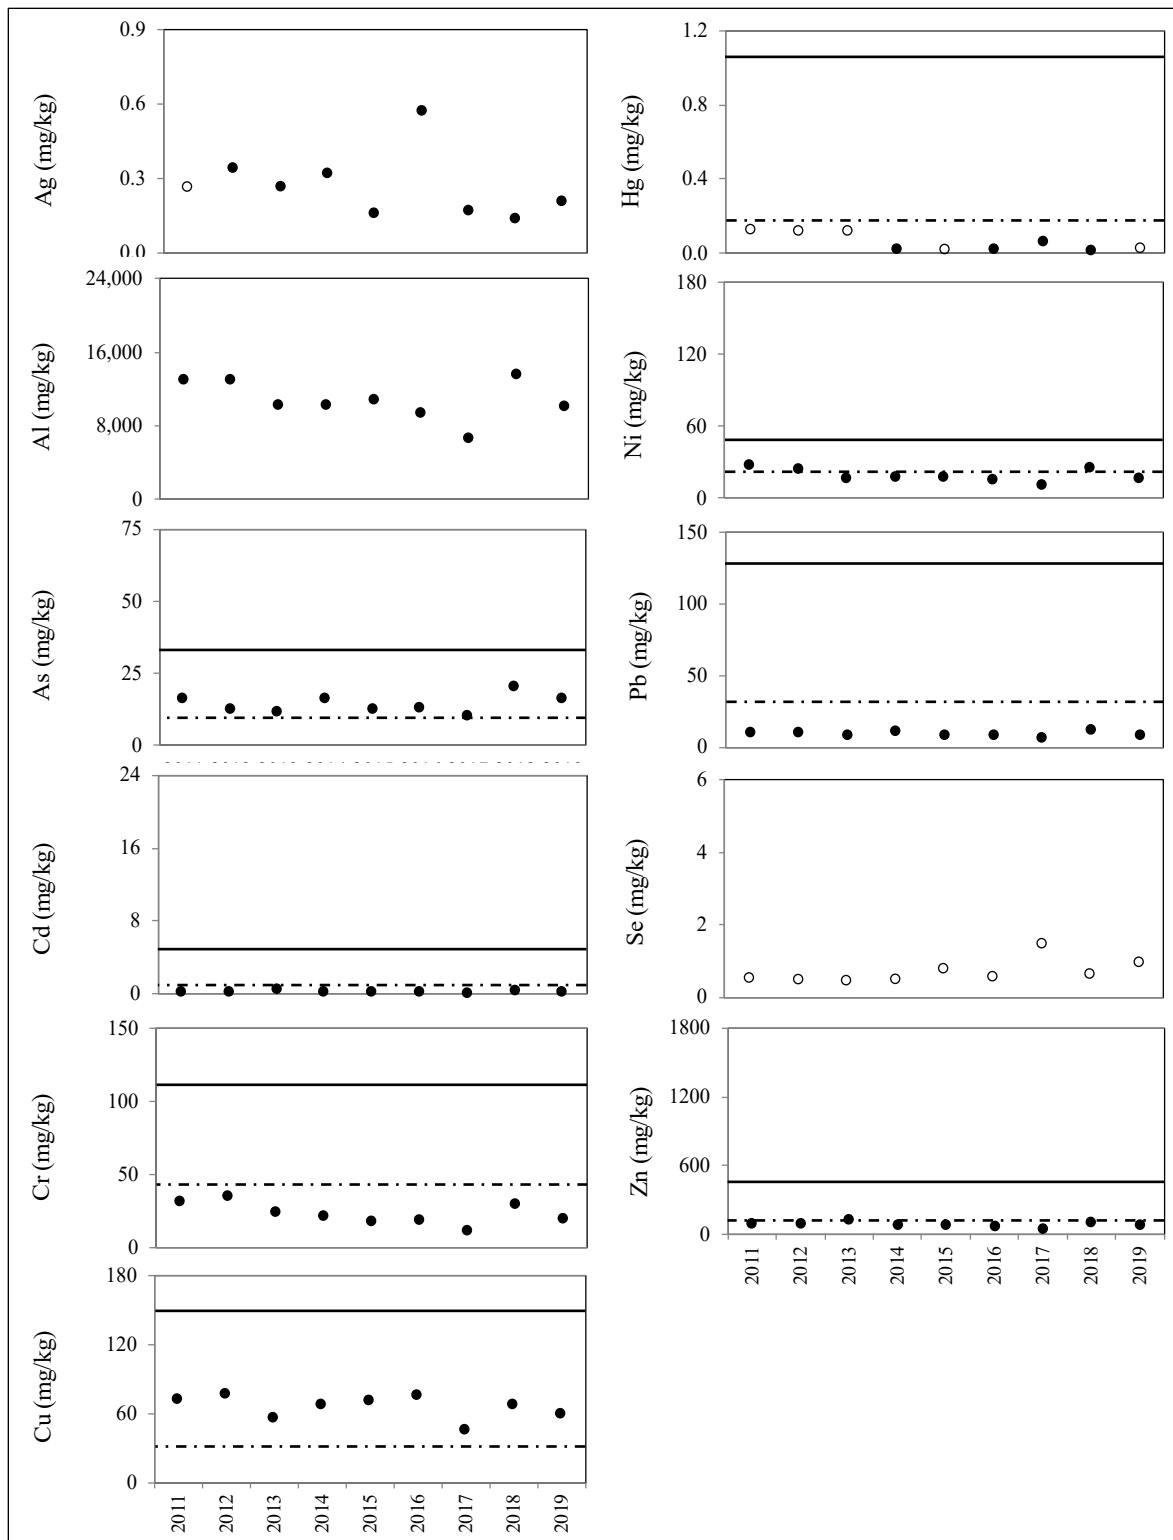

Figure 35.—Lower Johnson Creek sediment element concentrations, 2011–2019.

Note: Elements undetected (o) are presented at the method reporting limit. The dashed line represents TEC and solid line represents the PEC; guidelines are not published for Ag, Al, or Se (Buchman 2008).

## Upper Johnson Creek

### Benthic Macroinvertebrate Density and Community Composition

Among the 2019 Upper Johnson Creek BMI samples, we identified 25 taxa and estimate mean density at 3,369 BMI/m<sup>2</sup>, of which 70% were EPT insects, all within ranges observed 2011–2018 (Table 19; Figure 36). The Shannon Diversity and Evenness scores also were consistent with previous years. The dominant taxa were Ephemeroptera: *Baetis* and Diptera: Chironomidae, composing 29% and 28% of the samples.

Table 19.—Upper Johnson Creek BMI data summaries, 2011–2019.

	05/03/11	04/26/12	04/29/13	04/29/14	04/28/15	04/27/16	04/26/17	05/04/18	05/01/19

## SHERMAN CREEK

### Lower Sherman Creek

#### *Periphyton: Chlorophyll Density and Composition*

##### Sample Point 1

The 2019 Lower Sherman Creek SP1 mean chlorophyll *a* density was 2.74 mg/m<sup>2</sup>, within the range observed since 2011 (Table 20; Figure 37). The mean proportion of chlorophylls *a*, *b*, and *c* was similar to previous years (Figure 38).

Table 20.–Lower Sherman Creek SP1 mean chlorophylls *a*, *b*, and *c* densities, 2011–2019.

	07/28/11	07/26/12	07/29/13	07/28/14	07/27/15	07/25/16	07/25/17	07/24/18	08/02/19

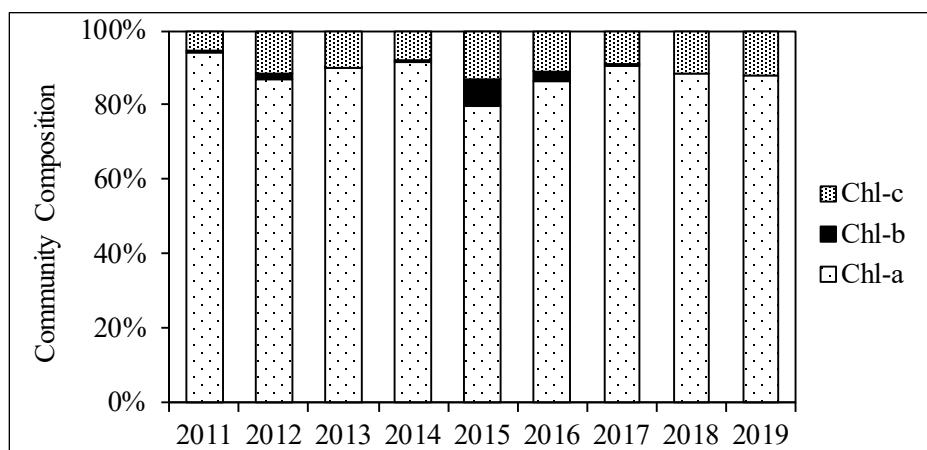

Figure 40.—Lower Sherman SP2 mean proportions of chlorophylls *a*, *b*, and *c*, 2011–2019.

## Benthic Macroinvertebrate Density and Community Composition

### Sample Point 1

Among the 2019 Lower Sherman Creek SP1 BMI samples, we identified 25 taxa and estimate mean density at 1,263 BMI/m<sup>2</sup>, of which 64% were EPT insects, all within ranges observed 2011–2018 (Table 22; Figure 41). The Shannon Diversity and Evenness scores were consistent with previous years. The dominant taxa were Ephemeroptera: *Baetis* and Diptera: Chironomidae, composing 34% and 27% of the samples.

Table 22.—Lower Sherman Creek SP1 BMI data summaries, 2011–2019.

	05/04/11	04/30/12	05/01/13	04/29/14	04/28/15	04/27/16	04/26/17	05/02/18	04/30/19

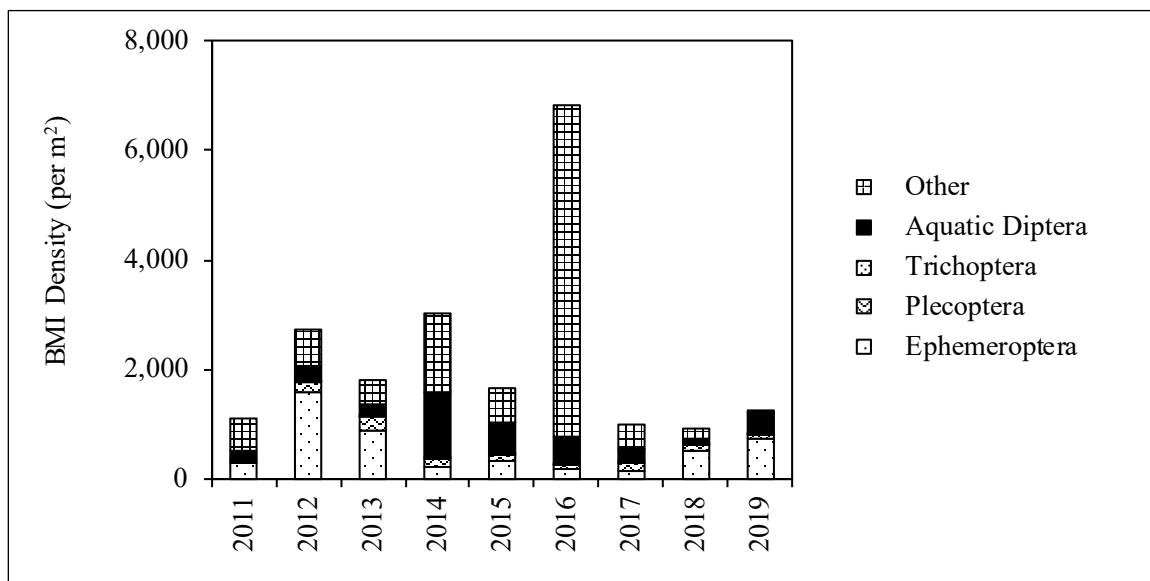

Figure 41.—Lower Sherman Creek SP1 mean BMI densities and community compositions, 2011–2019.

## Sample Point 2

Among the 2019 Lower Sherman Creek SP2 BMI samples, we identified 25 taxa and estimate mean density at 1,624 BMI/m<sup>2</sup>, of which 85% were EPT insects, all within ranges observed 2011–2018 (Table 23; Figure 42). The Shannon Diversity and Evenness scores were consistent with previous years. The dominant taxon was Ephemeroptera: *Baetis*, composing 55% of the samples.

Table 23.—Lower Sherman Creek SP2 BMI data summaries, 2011–2019.

	05/03/11	04/30/12	04/30/13	04/29/14	04/28/15	04/27/16	04/26/17	05/02/18	04/30/19

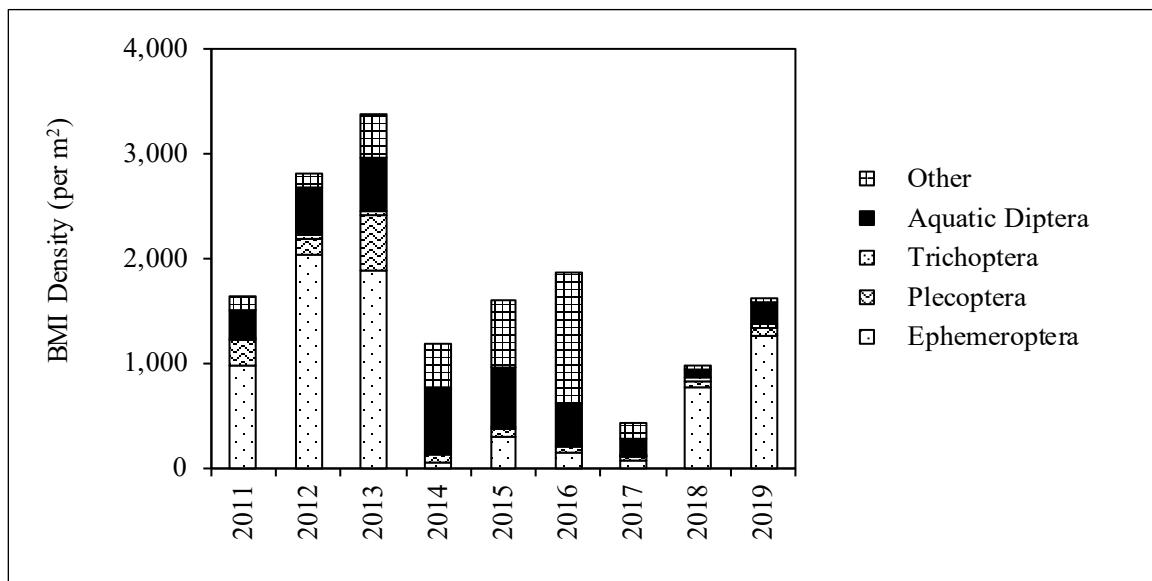

Figure 42.—Lower Sherman Creek SP2 mean BMI densities and community compositions, 2011–2019.

### ***Adult Salmon Counts***

We counted 2,816 pink salmon and 147 chum salmon in Lower Sherman Creek during 2019 (Table 24; Figure 43). Since coho salmon do not use Sherman Creek, we did not survey for adults.

Table 24.—Lower Sherman Creek adult salmon counts, 2011–2019.

	2011	2012	2013	2014	2015	2016	2017	2018	2019
Pink salmon	4,605	1,608	4,981	70	2,798	26	5,690	86	2,816
Chum salmon	0	0	12	0	1	5	122	7	147

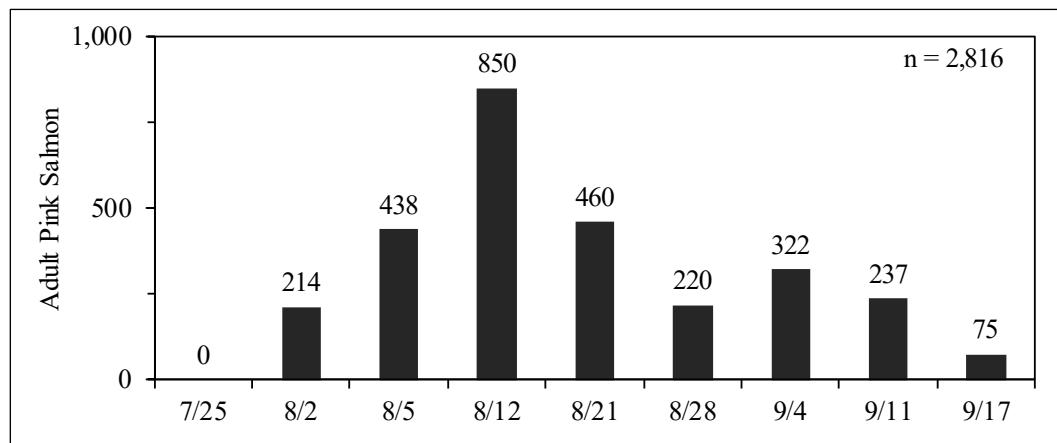

Figure 43.—Lower Sherman Creek weekly pink salmon count, 2019.

### ***Sediment Element Concentrations***

The 2019 Lower Sherman Creek sediment sample contained a greater As concentration than the range observed 2011–2018, and other element concentrations were within ranges previously observed (Figures 44, 45). The Cu and Ni concentrations remain above the TEC and the As concentration was above the PEC freshwater sediment toxicity guidelines, as observed in 2015 and 2018.

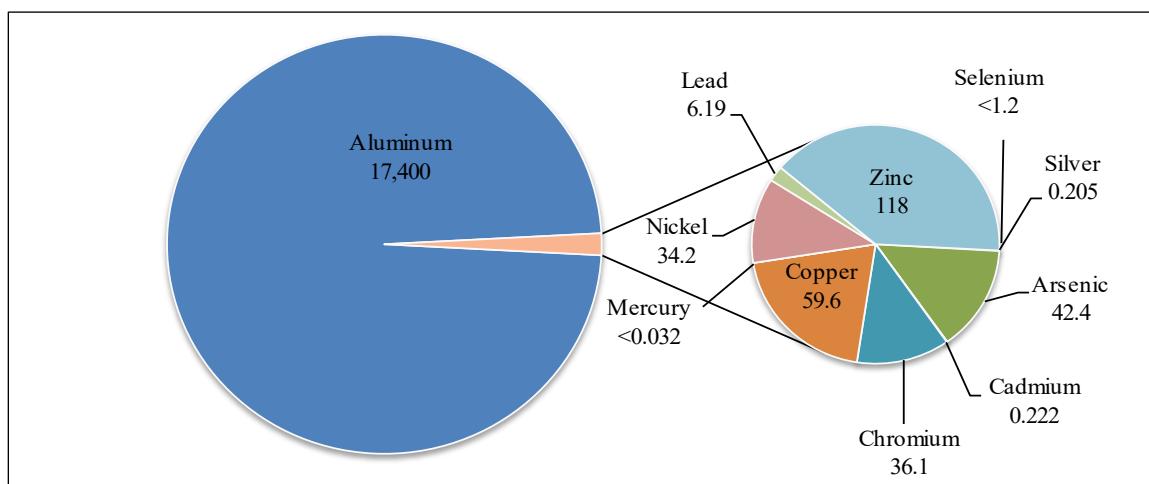

Figure 44.—Lower Sherman Creek sediment element concentrations (mg/kg), 2019.

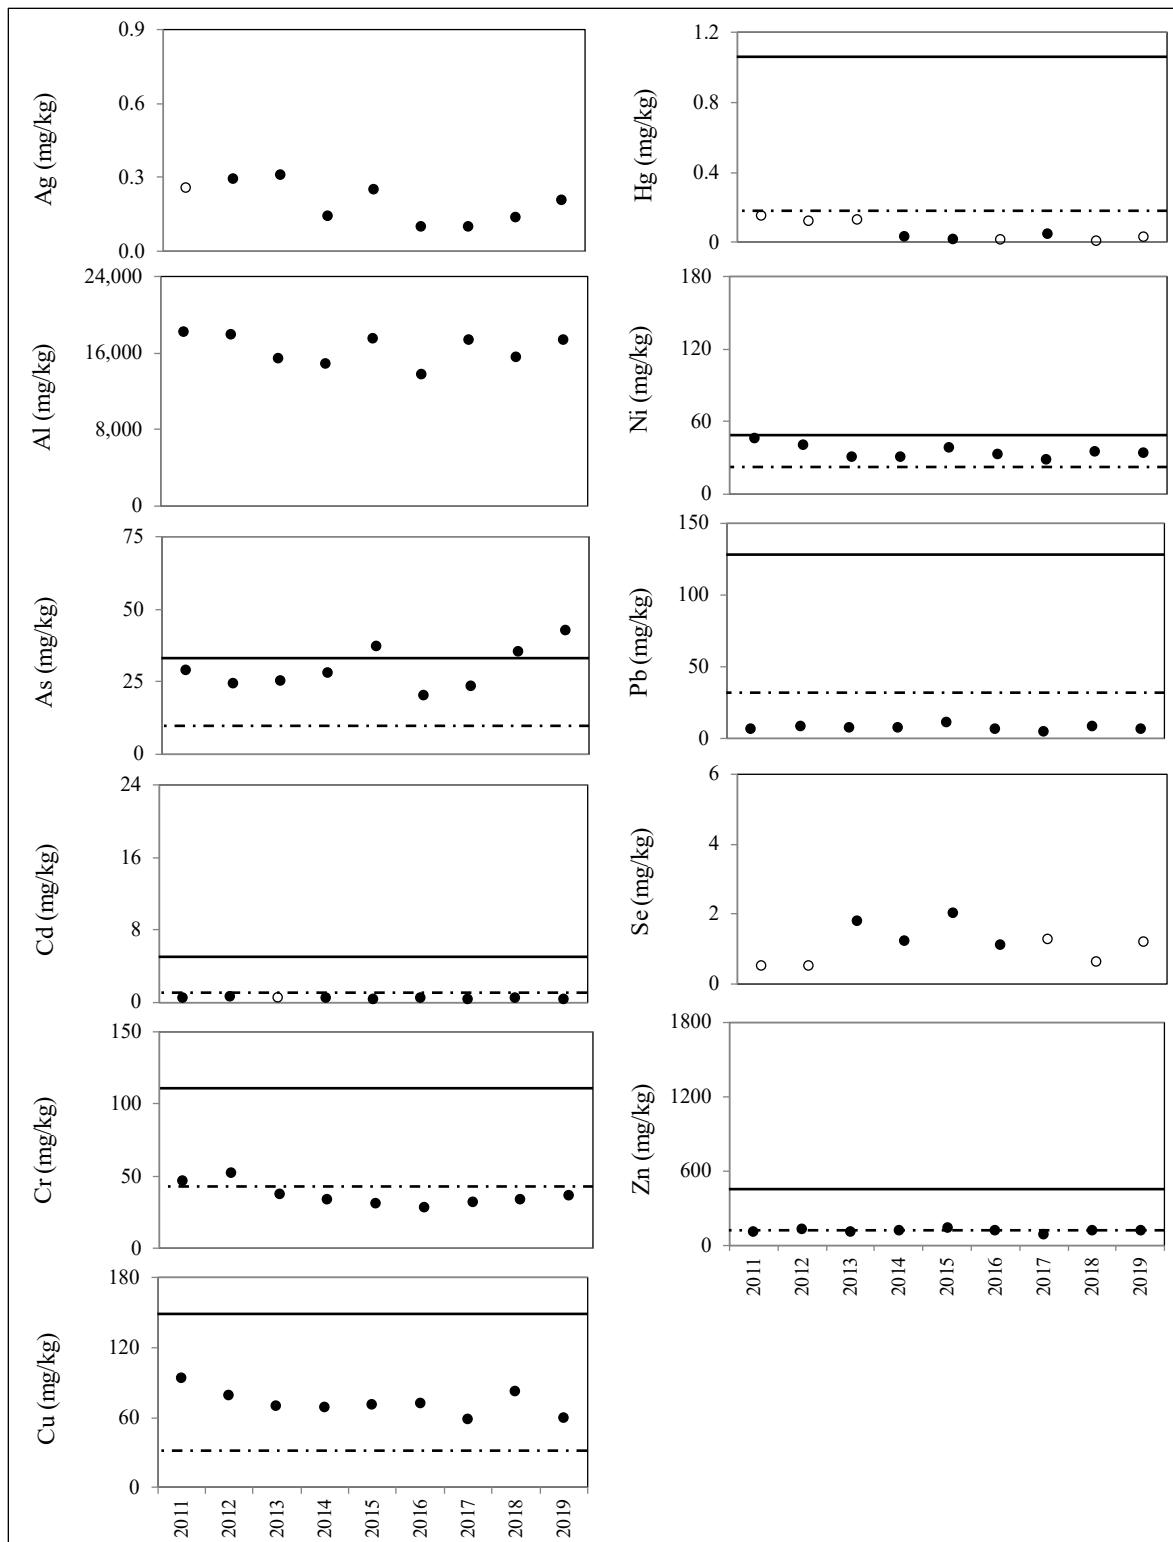

Figure 45.—Lower Sherman Creek sediment element concentrations, 2011–2019.

Note: Elements undetected (o) are presented at the method reporting limit. The dashed line represents TEC and solid line represents the PEC; guidelines are not published for Ag, Al, or Se (Buchman 2008).

**Analytical Report for Service Request No: K1906868**

Bill Kane  
Alaska Department of Fish and Game  
Division of Habitat  
802 3rd Street  
P.O. Box 110024  
Douglas, AK 99811-0024

**RE: Coeur AK Biomonitoring**

Dear Bill,

Enclosed are the results of the sample(s) submitted to our laboratory July 26, 2019  
For your reference, these analyses have been assigned our service request number **K1906868**.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at [www.alsglobal.com](http://www.alsglobal.com). All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3356. You may also contact me via email at [Kurt.Clarkson@alsglobal.com](mailto:Kurt.Clarkson@alsglobal.com).

Respectfully submitted,

**ALS Group USA, Corp. dba ALS Environmental**

A handwritten signature in black ink that reads "Kurt Clarkson". The signature is fluid and cursive, with "Kurt" on top and "Clarkson" below it.

Kurt Clarkson  
Sr. Project Manager

## Table of Contents

- Acronyms
- Qualifiers
- State Certifications, Accreditations, And Licenses
- Case Narrative
- Chain of Custody
- Total Solids
- General Chemistry
- Metals

## Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

## Inorganic Data Qualifiers

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated value.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.  
*DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.
- H The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

## Metals Data Qualifiers

- # The control limit criteria is not applicable. See case narrative.
- J The result is an estimated value.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.  
*DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.
- Q See case narrative. One or more quality control criteria was outside the limits.

## Organic Data Qualifiers

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimated value.
- J The result is an estimated value.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.  
*DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.

## Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at [www.alsglobal.com](http://www.alsglobal.com) or at the accreditation bodies web site.

Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/analyte is offered by that state.

## Case Narrative

**ALS Environmental—Kelso Laboratory**  
1317 South 13th Avenue, Kelso, WA 98626  
Phone (360)577-7222 Fax (360)636-1068  
[www.alsglobal.com](http://www.alsglobal.com)

**Client:** Alaska Department of Fish and Game  
**Project:** Coeur AK Biomonitoring  
**Sample Matrix:** Sediment

**Service Request:** K1906868  
**Date Received:** 07/26/2019

#### CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier II level requested by the client.

#### Sample Receipt:

Four sediment samples were received for analysis at ALS Environmental on 07/26/2019. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at minimum in accordance with the analytical method requirements.

#### Metals:

Method 200.8, 07/31/2019: The Relative Percent Difference (RPD) for the replicate analysis of Silver in sample 2019KGMLJC was outside the normal ALS control limits. The variability in the results was attributed to the heterogeneous character of the sample. Standard mixing techniques were used, but were not sufficient for complete homogenization of this sample.

#### General Chemistry:

No significant anomalies were noted with this analysis.

A handwritten signature in black ink that reads "Kurt Clawson".

**Analytical Report for Service Request No: K1907246**

Kate Kanouse  
Alaska Department of Fish and Game  
Division of Habitat  
802 3rd Street  
P.O. Box 110024  
Douglas, AK 99811-0024

**RE: Coeur AK Biomonitoring**

Dear Kate,

Enclosed are the results of the sample(s) submitted to our laboratory August 07, 2019  
For your reference, these analyses have been assigned our service request number **K1907246**.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at [www.alsglobal.com](http://www.alsglobal.com). All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3356. You may also contact me via email at [Kurt.Clarkson@alsglobal.com](mailto:Kurt.Clarkson@alsglobal.com).

Respectfully submitted,

**ALS Group USA, Corp. dba ALS Environmental**

A handwritten signature in black ink that reads "Kurt Clarkson".

Kurt Clarkson  
Sr. Project Manager

## Table of Contents

- Acronyms
- Qualifiers
- State Certifications, Accreditations, And Licenses
- Chain of Custody
- Total Solids
- General Chemistry
- Metals

## Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

## Inorganic Data Qualifiers

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated value.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.  
*DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.
- H The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

## Metals Data Qualifiers

- # The control limit criteria is not applicable. See case narrative.
- J The result is an estimated value.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.  
*DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.
- Q See case narrative. One or more quality control criteria was outside the limits.

## Organic Data Qualifiers

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimated value.
- J The result is an estimated value.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.  
*DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.

## Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at [www.alsglobal.com](http://www.alsglobal.com) or at the accreditation bodies web site.

Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/analyte is offered by that state.

## Cooler Receipt and Preservation Form

Client Cœur A&L ADFG Service Request K19 07246  
 Received: 8-7-19 Opened: 8-7-19 By: NP Unloaded: 8-7-19 By: AK

1. Samples were received via? USPS Red Ex UPS DHL PDX Courier Hand Delivered
2. Samples were received in: (circle) Cooler Box Envelope Other NA
3. Were custody seals on coolers? NA Y N If yes, how many and where? 1 side  
 If present, were custody seals intact? Y N If present, were they signed and dated? Y N

Raw Cooler Temp	Corrected Cooler Temp	Raw Temp Blank	Corrected Temp Blank	Corr. Factor	Thermometer ID	Cooler/COC ID	Tracking Number	NA	Filed
4.5	4.6	5.9	6.0	0.1	370	101357	7889 5209 1438		

4. Packing material: Inserts Baggies Bubble Wrap Gel Packs Wet Ice Dry Ice Sleeves
5. Were custody papers properly filled out (ink, signed, etc.)? NA Y N
6. Were samples received in good condition (temperature, unbroken)? Indicate in the table below.  
 If applicable, tissue samples were received: Frozen Partially Thawed Thawed
7. Were all sample labels complete (i.e analysis, preservation, etc.)? NA Y N
8. Did all sample labels and tags agree with custody papers? Indicate major discrepancies in the table on page 2. NA Y N
9. Were appropriate bottles/containers and volumes received for the tests indicated? NA Y N
10. Were the pH-preserved bottles (see SMO GEN SOP) received at the appropriate pH? Indicate in the table below NA Y N
11. Were VOA vials received without headspace? Indicate in the table below. NA Y N
12. Was C12/Res negative? NA Y N

## Replicate Sample Summary

## Total Metals

**Sample Name:** 2019KGMUSC                           **Units:** mg/Kg  
**Lab Code:** K1907246-001                           **Basis:** Dry

Analyte Name	Analysis Method	MRL	Sample Result	Duplicate Sample KQ1911124-01			
				Result	Average	RPD	RPD Limit
Mercury	7471B	0.024	0.028	0.073	0.051	90 #	20

**Results flagged with an asterisk (\*) indicate values outside control criteria.**

**Results flagged with a pound (#) indicate the control criteria is not applicable.**

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.
