LIST OF APPENDICES

APPENDIX A: CHLOROPHYLL DATA

- A.1. Greens Creek Site 48 chlorophylls *a*, *b*, and *c* densities.
- A.2. Greens Creek Site 63 chlorophylls *a*, *b*, and *c* densities.
- A.3. Greens Creek Site 54 chlorophylls *a*, *b*, and *c* densities.
- A.4. Tributary Creek Site 9 chlorophylls *a*, *b*, and *c* densities.
- A.5. Tributary Creek Site 1847 chlorophylls *a*, *b*, and *c* densities.

APPENDIX B: BENTHIC MACROINVERTEBRATE DATA

- B.1. Greens Creek Site 48 BMI data summary.
- B.2. Greens Creek Site 63 BMI data summary.
- B.3. Greens Creek Site 54 BMI data summary.
- B.4. Tributary Creek Site 9 BMI data summary.
- B.5. Tributary Creek Site 1847 BMI data summary.

APPENDIX C: JUVENILE FISH DATA

- C.1. Greens Creek Site 48 Dolly Varden char capture data.
- C.2. Greens Creek Site 63 Dolly Varden char capture data.
- C.3. Greens Creek Site 54 resident fish capture data.
- C.4. Greens Creek Site 54 coho salmon capture data.
- C.5. Tributary Creek Site 9 resident fish capture data.
- C.6. Tributary Creek Site 9 coho salmon capture data.
- C.7. Greens Creek Site 48 Dolly Varden char length frequency distributions.
- C.8. Greens Creek Site 63 Dolly Varden char length frequency distributions.
- C.9. Greens Creek Site 54 Dolly Varden char length frequency distributions.
- C.10. Greens Creek Site 54 coho salmon length frequency distributions.
- C.11. Tributary Creek Site 9 Dolly Varden char length frequency distributions.
- C.12. Tributary Creek Site 9 coho salmon length frequency distributions.

APPENDIX D: JUVENILE FISH ELEMENT CONCENTRATIONS DATA AND LAB REPORT

- D.1. Greens Creek Site 48 Dolly Varden char element concentrations.
- D.2. Greens Creek Site 63 Dolly Varden char element concentrations.
- D.3. Greens Creek Site 54 Dolly Varden char element concentrations.
- D.4. Tributary Creek Site 9 Dolly Varden char element concentrations.
- D.5. Dolly Varden char element concentrations laboratory report, 2021.

ACKNOWLEDGEMENTS

Hecla Greens Creek Mining Company provided financial support and Greens Creek Mine environmental staff Dave Landes, Cameron Sell, Doug Maller, and Jaden Cummings provided logistical support. Dave Landes reviewed the draft report.

Several Habitat Section staff assisted with this project. Habitat Biologists Greg Albrecht, Evan Fritz, and Kelsey Dean, and Fish and Wildlife Technician Ben Landes assisted with data collection. Kelsey assisted with periphyton processing. Greg identified benthic macroinvertebrates and assisted with data verification. Evan also assisted with data entry and verification. Habitat Biologist Erika King assisted with data entry and verification. Habitat Biologist Jesse Lindgren assisted with data verification and reviewed the report. Habitat Section Operations Manager Dr. Al Ott, Southeast Regional Supervisor Kate Kanouse, and Habitat Biologist Dylan Krull reviewed and edited the report.

Thank you all for your contribution.

EXECUTIVE SUMMARY

Since 2001, the Alaska Department of Fish and Game Habitat Section completed the aquatic biomonitoring studies the U.S. Forest Service and Alaska Department of Environmental Conservation require for Hecla Greens Creek Mining Company's Greens Creek Mine. This partnership provides the Alaska Department of Fish and Game the opportunity to gather and review data, and help identify, assess, and resolve issues that could affect aquatic resources near the mine site. The aquatic studies include sampling periphyton, benthic macroinvertebrates, and juvenile fish in Greens Creek and Tributary Creek—two streams near mine development and operations. In 2021, we completed studies at Greens Creek Site 63 and Site 54, and Tributary Creek Site 9 and Site 1847.

The National Weather Service (2022) reports the Juneau area experienced annual precipitation (194 cm) about 14% above normal^a and snowfall (348 cm) about 56% above normal.

Among the 2021 Greens Creek samples, mean chlorophyll *a* densities were among the lowest previously observed; mean benthic macroinvertebrate densities and the proportions of sensitive insects also were among the lowest previously observed. High streamflow three weeks prior to sampling may have influenced the results, as in other years. Among the Tributary Creek samples, mean chlorophyll *a* densities were among the greatest previously observed and mean benthic macroinvertebrate densities and the proportions of sensitive insect species were within the ranges previously observed. The Site 1847 data collected 2018–2021 suggest the periphyton community is similar to Site 9; the benthic macroinvertebrate community includes more organisms and sensitive species than at Site 9. The data suggest Site 1847 provides more suitable habitats for sampling periphyton and benthic macroinvertebrates; I recommend discontinuing periphyton and benthic macroinvertebrate sampling at Site 9 and collecting these samples instead at Site 1847, as part of the ongoing annual biomonitoring program.

Juvenile Dolly Varden char *Salvelinus malma* abundance at Greens Creek Site 63 was among the lowest previously observed; at Site 54, abundance was similar to previous years. At both Greens Creek sites, mean fish conditions were similar to previous years. We captured one juvenile coho salmon *Oncorhynchus kisutch* at Site 54—the fewest observed during a single trapping event since Hecla Greens Creek Mining Company repaired and fortified the Greens Creek fish pass in 2016. At Tributary Creek Site 9, juvenile Dolly Varden char abundance was among the lowest observed; coho salmon continue to be the most abundant juvenile fish species and the mean fish condition of Dolly Varden char and coho salmon were similar to previous years.

At all sample sites in 2021, Dolly Varden char median element concentrations were within ranges previously observed. We did not detect significant differences in fish element concentrations between Greens Creek sample sites. Median element concentrations above values reported for sample sites with mining-related influence elsewhere in Alaska include mercury at Tributary Creek Site 9 and zinc at Greens Creek Sites 63 and 54, as frequently observed historically. In 2020, several elevated element concentrations were detected in Tributary Creek samples; we have since collected additional juvenile Dolly Varden char and sediment samples throughout the project area for element concentration analyses and will continue to work with Hecla Greens Creek Mining Company to further investigate the elevated concentrations.

^a Mean value, 1991–2020.

INTRODUCTION

The Greens Creek Mine is located about 29 km southwest of Juneau by air near Hawk Inlet on the west side of Admiralty Island, within the Tongass National Forest and the Admiralty Island National Monument, both administered by the U.S. Forest Service (USFS; 2013). The mine has operated since 1989, except between 1993 and 1996 when the mine temporarily closed, and produces gold, lead, silver, and zinc concentrates. Hecla Greens Creek Mining Company (HGCMC), a subsidiary of Hecla Mining Company of Coeur d'Alene, ID, has owned and operated the mine since April 2008.

Most mine infrastructure is located in two drainages that support resident and anadromous fish: the dry-stack tailings disposal facility (TDF) at the headwaters of Tributary Creek, and the mill, mine facilities, and waste rock storage areas adjacent to Greens Creek (Figure 1). The project General Plan of Operations Integrated Monitoring Plan (IMP; HGCMC 2020) and Alaska Department of Environmental Conservation (ADEC) Waste Management Permit 2020DB0001 require aquatic studies in Greens Creek and Tributary Creek near mine facilities to document stream health.

The Alaska Department of Fish and Game (ADF&G) Habitat Section began the aquatic studies for the Greens Creek Mine in 2001. Reports summarizing sampling results from previous years are in Weber Scannell and Paustian (2002), Jacobs et al. (2003), Durst and Townsend (2004), Durst et al. (2005), Durst and Jacobs (2006–2010), Kanouse (2011–2012), Kanouse and Brewster (2013–2014), Kanouse (2015), Brewster (2016), Zutz (2017–2018), Kane and Legere (2019), and Kane (2020, 2021).

PURPOSE

This technical report summarizes the 2021 sample results and documents the condition of biological communities in Greens Creek and Tributary Creek near mine development and operations, satisfying the biological monitoring requirements for ADEC Waste Management Permit 2020DB0001 and HGCMC's approved IMP (2020).

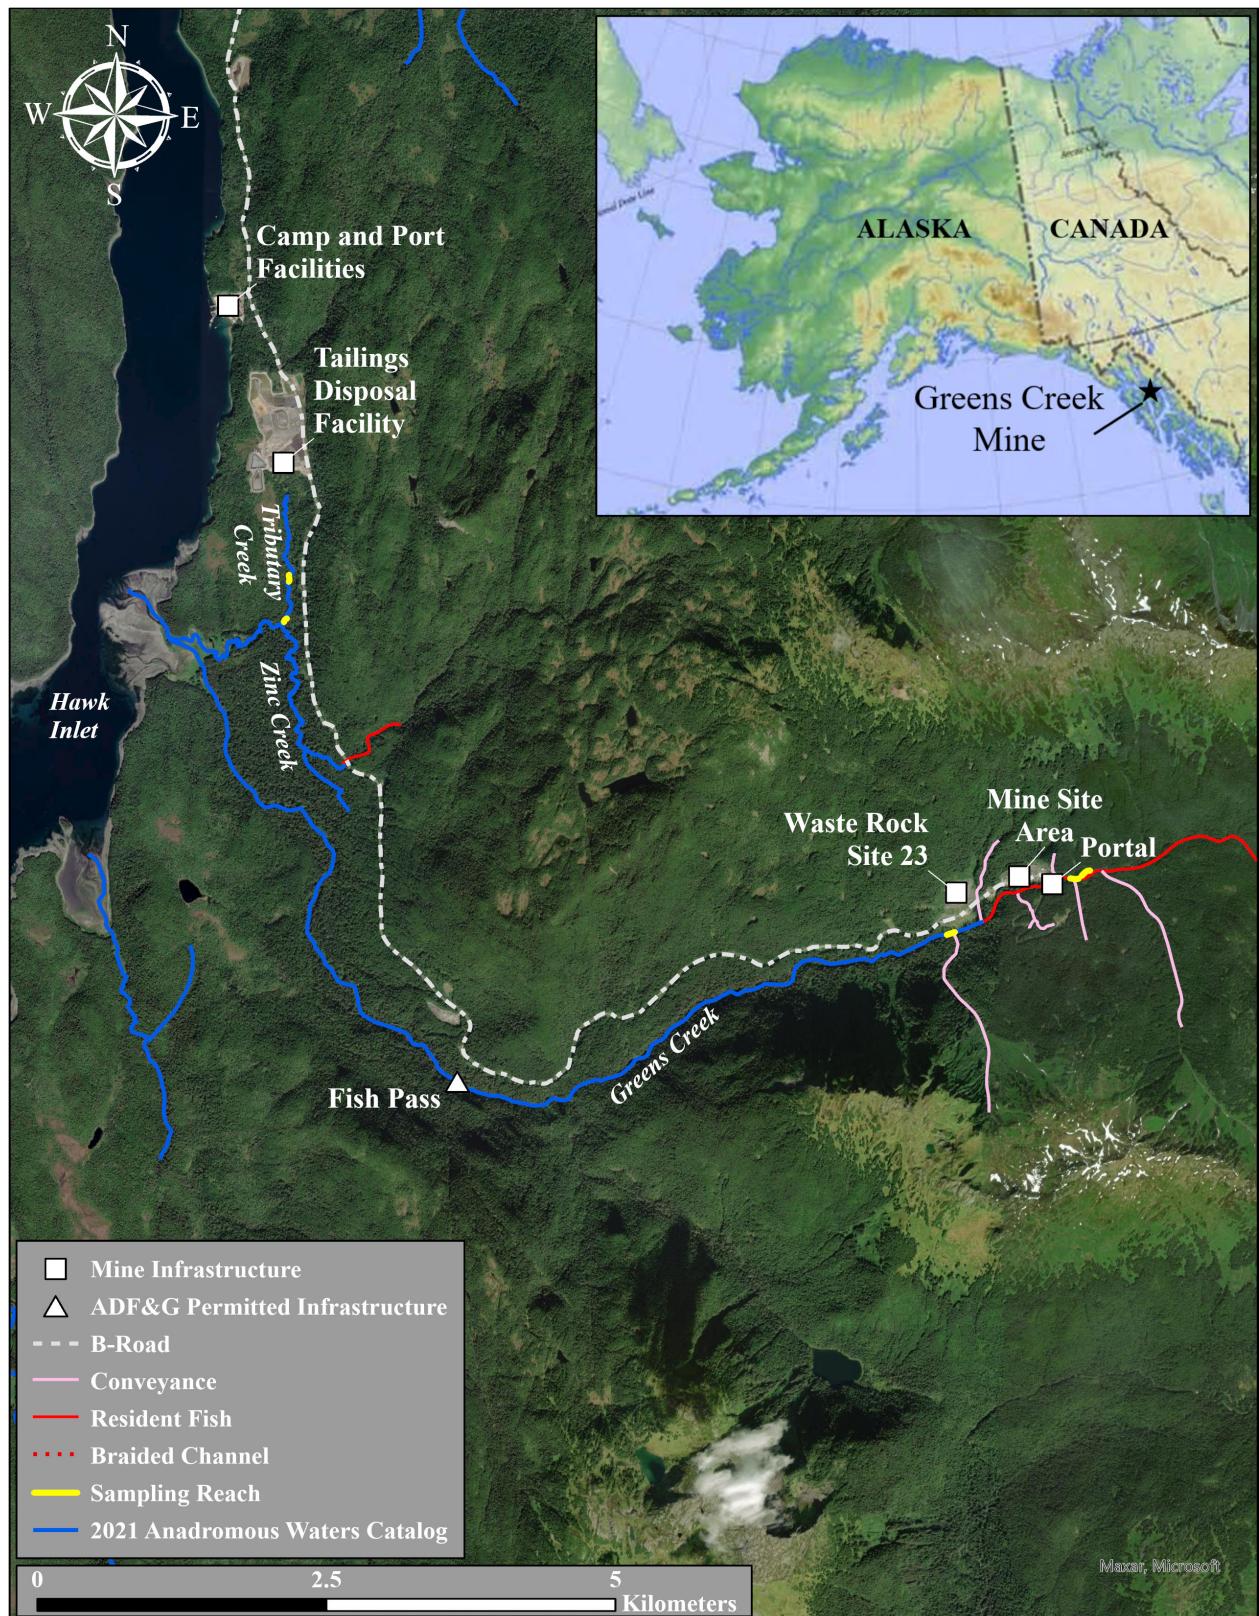

Figure 1.—Greens Creek Mine area.

AQUATIC BIOMONITORING

In 2021, we completed the following studies at four sample sites (Table 1):

- Abundance and condition of juvenile fish;
- Whole body concentrations of silver, cadmium, copper, mercury, lead, selenium, and zinc of Dolly Varden char;
- Periphyton biomass, estimated by chlorophyll *a*; and
- Abundance and community composition of benthic macroinvertebrates.

Table 1.—Aquatic biomonitoring study sample sites, 2021.

Location	Biomonitoring reach	Latitude ^a	Longitude ^a
Greens Creek Site 63 ^b (2018–2021)	Fish – Upper extent	58.0827	-134.6286
	Fish – Lower extent	58.0832	-134.6295
	Periphyton and benthic macroinvertebrates	58.0831	-134.6300
Greens Creek Site 54 (2001–2021)	Fish – Upper extent	58.0785	-134.6469
	Fish – Lower extent	58.0783	-134.6478
	Periphyton and benthic macroinvertebrates	58.0783	-134.6466
Tributary Creek Site 9 ^c (2001–2021)	Upper extent	58.1055	-134.7450
	Lower extent	58.1050	-134.7450
Tributary Creek Site 1847 (2018–2021)	Periphyton and benthic macroinvertebrates	58.1018	-134.7458

^a WGS84 datum.

^b Samples were collected at Greens Creek Site 48 2001–2017.

^c At Site 9, fish, periphyton, and benthic macroinvertebrate samples are collected in the same reach.

STUDY AREA

We sampled Greens Creek Site 54 and Tributary Creek Site 9 annually since 2001, and Greens Creek reference Site 63 2018–2021, which replaced Greens Creek reference Site 48 where we sampled 2001–2017.^b In fall 2017, Greens Creek shifted river left and abandoned the channel at Site 48; the adjacent, newly carved channel was too young and dynamic for sampling biological communities as part of the aquatic biomonitoring program.^c We also continued sampling Tributary Creek Site 1847 near the stream mouth to investigate periphyton and benthic macroinvertebrate communities in riffle habitats more suitable for sampling than at Site 9.^{d,e}

^b We sampled Greens Creek Site 6 in 2001, 2006, and 2011 (Kanouse 2012).

^c Kate Kanouse and Johnny Zutz, Habitat Biologists, to Jackie Timothy, Southeast Regional Supervisor, ADF&G Division of Habitat. Memorandum: GCM Greens Creek sampling Sites 48 and 63; dated September 7, 2018. Unpublished document can be obtained from the Southeast Regional Supervisor, ADF&G Habitat Section, 802 3rd Street, Douglas, AK.

Unpublished document can be obtained from the Southeast Regional Supervisor, ADF&G Habitat Section, 802 3rd Street, Douglas, AK.

Greens Creek

Greens Creek drains a 58.5 km² watershed with the main channel measuring 16 km from the alpine headwaters to the mouth in Hawk Inlet (USGS 2021). At each sample site, gradients range from 2% to 4%, cobble is the dominant substrate, and large woody debris is common, characteristic of a medium width mixed control channel type (Paustian 2010). The creek is fed by snowmelt in the spring and rain throughout the year. Snowpack influences the magnitude of peak discharge in early summer; rain events during fall also cause peak discharge events.

The lower 10 km of Greens Creek (Stream No. 112-65-10240) provides habitat for chum salmon *O. keta*, coho salmon, pink salmon *O. gorbuscha*, and Dolly Varden char (Giefer and Blossom 2021). ADF&G Division of Commercial Fisheries staff survey returning chum and pink salmon in Greens Creek as part of their in-season assessment of salmon run strength (D. Harris, Commercial Fisheries Area Management Biologist, ADF&G, Juneau, personal communication).

Greens Creek discharge data is recorded at U.S. Geological Survey (USGS) Site 15101490^f, located downstream of Sites 48 and 63, 1350 Creek, Cub Creek, and Hecla's water withdrawal, upstream of mining activities and represents about 40% of the watershed draining to Hawk Inlet.

Greens Creek Site 48 and Site 63

Prior to the river avulsion in fall 2017, we sampled Greens Creek Site 48 which is located upstream of mining activities, except exploratory drilling, near 265 m elevation and about 0.8 km upstream of the mine portal (Figure 2). The new channel circumventing Site 48 (Figures 3, 4) is further stabilizing, and we completed the aquatic biomonitoring studies downstream at Site 63 for a third consecutive year.

Like Site 48, Site 63 is located near 265 m elevation, downstream of Big Sore Creek, and upstream of mining activities (Figure 2); unlike Site 48, 1350 Creek flows into the Site 63 sampling reach, which was unavoidable due to the limited suitable sampling areas between Big Sore Creek and the portal. Reference data collected at Site 48 and Site 63 are compared to data collected downstream of mining activities at Site 54. Resident Dolly Varden char is the only fish species documented at Sites 48 and 63; the infiltration gallery concrete weir near the mine portal precludes upstream fish passage. The upper extent of the 50 m juvenile fish study reach was located at the new channel confluence; periphyton and macroinvertebrate sampling occur downstream of the fish sample reach (Figure 5).

^f Prior to February 16, 1999, the gage was located 9 m upstream and at 3 m greater elevation (USGS 2022).

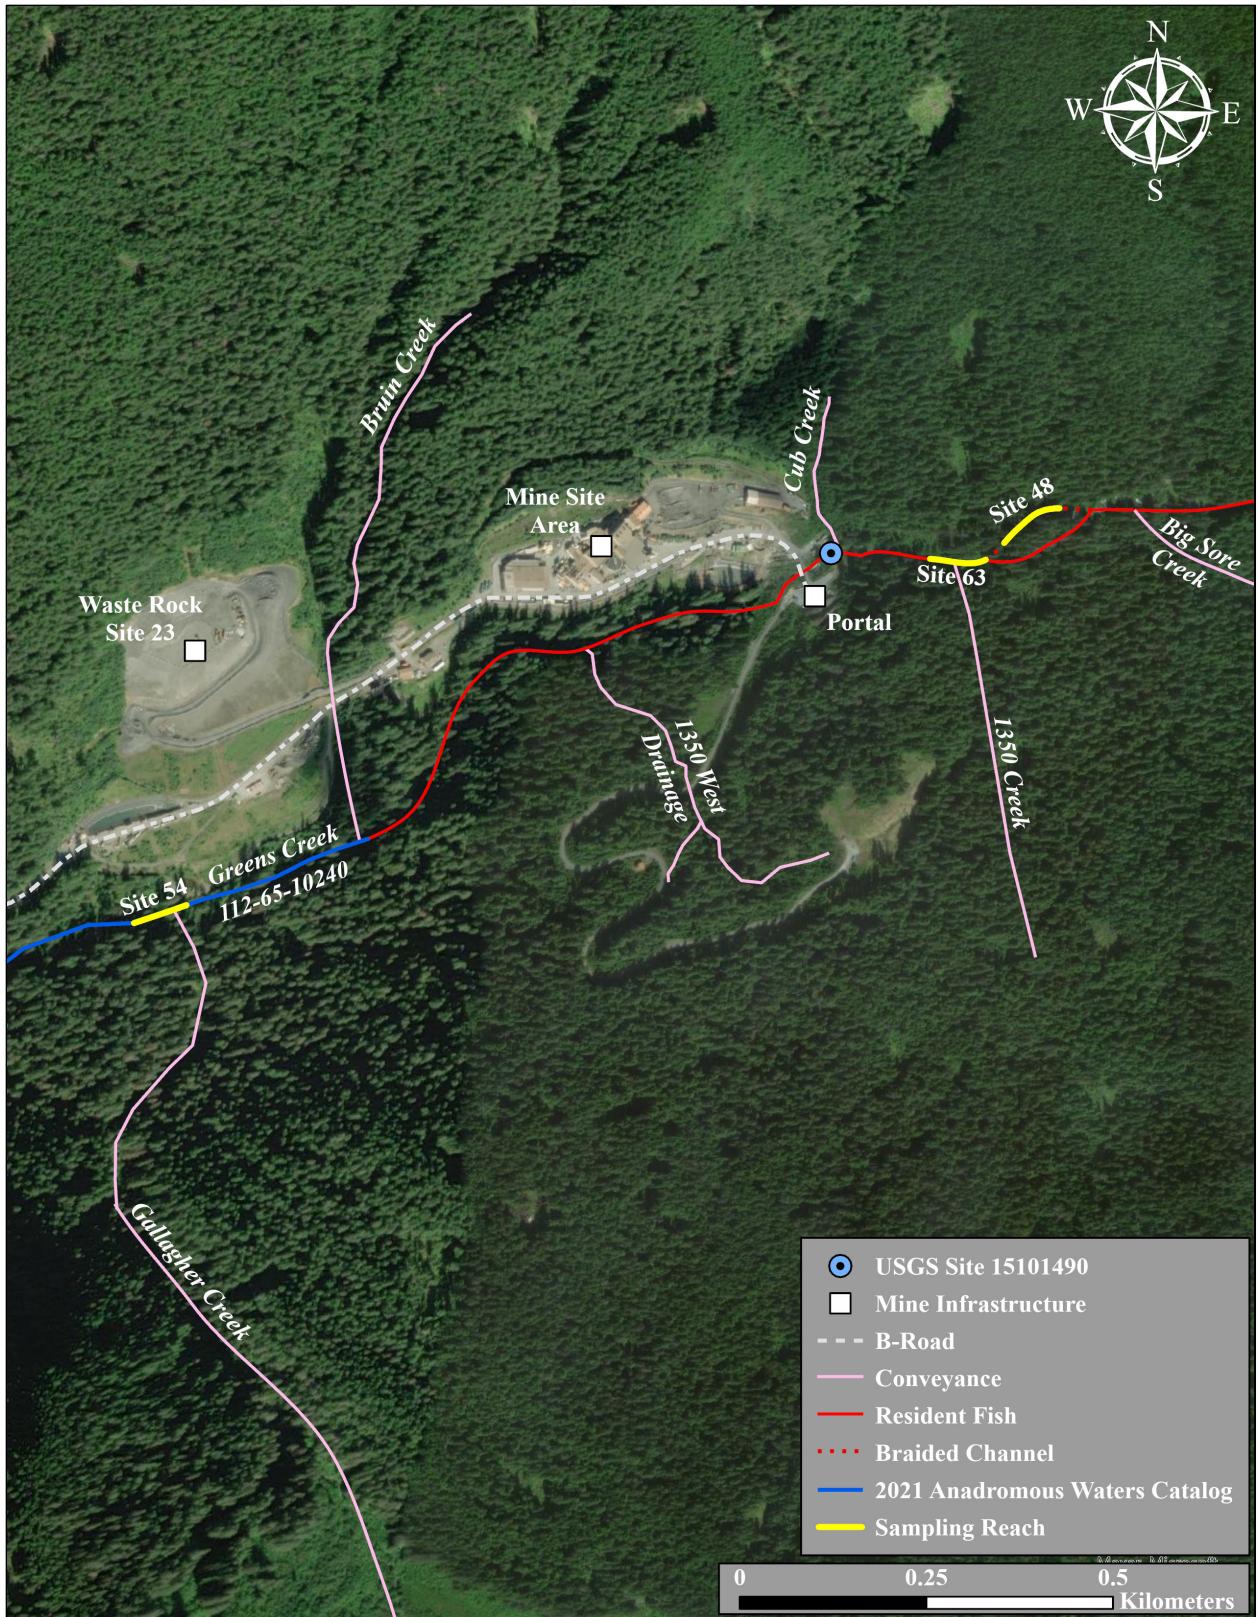

Figure 2.—Greens Creek Sites 48, 63, and 54.

Figure 3.—Greens Creek Site 48 within the abandoned channel braid upstream of Site 63, July 12, 2021.

Figure 4.—Established channel adjacent to the abandoned channel wherein Greens Creek Site 48 is located, July 12, 2021.

Figure 5.—Greens Creek Site 63 periphyton and benthic macroinvertebrate sample reach, July 12, 2021.

Greens Creek Site 54

Site 54 is located downstream of the Bruin Creek confluence and adjacent to waste rock storage Site 23, near 225 m elevation and about 1.8 km downstream of the mine portal (Figure 2). Data collected 2001–2021 at Site 54 are compared to reference Site 48 and Site 63 to detect potential changes from waste rock storage areas, storm water ponds, and the mine site upstream. Between Site 48 and Site 54, four tributaries drain to Greens Creek: 1350 Creek, 1350 West Drainage, Cub Creek, and Bruin Creek. Gallagher Creek enters Greens Creek at the upper extent of the fish sample reach. Periphyton and benthic macroinvertebrate sampling occur about 30 m upstream of the fish sample reach (Figures 6, 7).

Since 2001, we documented coho salmon, Dolly Varden char, cutthroat trout *O. clarkii*, and rainbow trout *O. mykiss* at Site 54.^g In 2021, we caught 1 juvenile coho salmon—among the fewest observed in a single trapping event since Hecla Greens Creek Mining Company repaired and fortified the Greens Creek fish pass in 2016.^h Anadromous fish access the site via a fish pass about 5.6 km upriver from the mouth.

^g In 2007 and 2008, two cutthroat trout were observed; one rainbow trout was observed in 2020.

^h In 1989, Greens Creek Mining Company installed the engineered fish pass as mitigation for impacts to Tributary Creek from the TDF. Three weirs provide step pools for adult coho salmon passage through a natural bedrock chute that prevents upstream fish migration. In November 2005, flood flows caused by a heavy rainstorm damaged the fish pass, limiting upstream adult coho salmon passage in subsequent years. Hecla repaired and fortified the fish pass in March 2016 and inspects the structure seasonally. We observed young-of-year coho salmon in 2017 and 2021, and two age classes 2018–2020, demonstrating successful adult coho salmon passage occurred during the prior fall spawning seasons.

Figure 6.–Upper extent of the Greens Creek Site 54 fish sample reach, July 12, 2021.

Figure 7.–Periphyton and benthic macroinvertebrate sample collection at Greens Creek Site 54, July 12, 2021.

Tributary Creek

Tributary Creek drains a 1.7 km^2 watershed (USFS 2013) and the main channel measures about 1.6 km between its headwaters and confluence with Zinc Creek (Stream No. 112-65-10230; Figure 8). The TDF occupies the headwaters of the watershed. Tributary Creek is a lowland stream characterized as a narrow low gradient flood plain channel type (Paustian 2010). Stream gradient varies 1–2%, organics and sand are the dominant substrates with gravel present near the mouth, and large and small woody debris are present. Discharge estimates based on field measurements and limited gage data suggest annual mean discharge is less than $3 \text{ ft}^3/\text{s}$ (USFS 2003).

Tributary Creek (Stream No. 112-65-10230-2007) provides habitat for coho salmon, pink salmon, and Dolly Varden char (Giefer and Blossom 2021).

Figure 8.—Tributary Creek Site 9 and Site 1847.

Tributary Creek Site 9

Site 9 is located about 1.0 km downstream of the TDF at 25 m elevation and is sampled to detect potential changes from the TDF. We documented coho salmon, Dolly Varden char, cutthroat and rainbow trout, and sculpin *Cottus* sp. at the site. Periphyton and benthic macroinvertebrate sampling occur within the juvenile fish sampling reach.

Greens Creek Mine TDF expansions and upstream beaver activity have changed Tributary Creek streamflow patterns and sediment composition at Site 9 since we began sampling in 2001 (Figure 9). The current conditions limit our ability to sample periphyton and benthic macroinvertebrates in riffles. In 2021, we sampled periphyton and benthic macroinvertebrates for the fourth consecutive year at Tributary Creek Site 1847, downstream of Site 9 near the stream mouth, to investigate periphyton and benthic macroinvertebrate communities in riffle habitats more suitable for sampling than at Site 9.

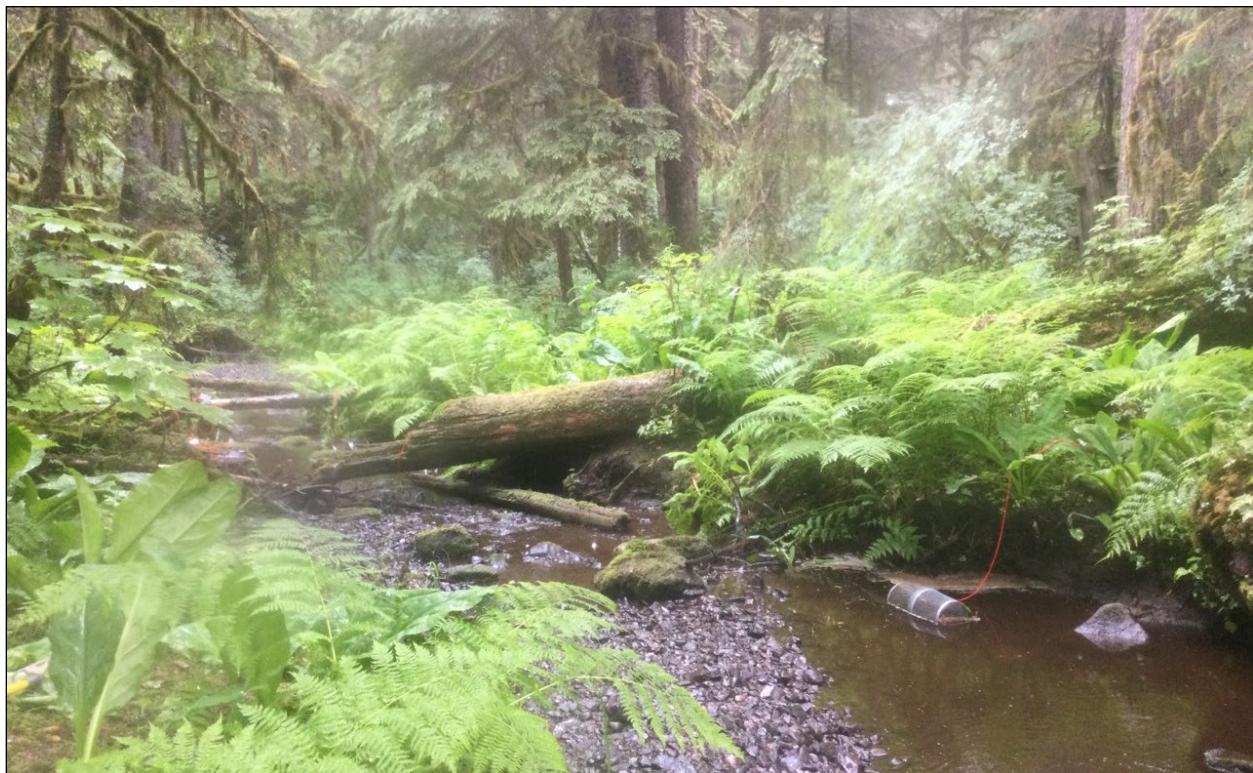

Figure 9.—Tributary Creek Site 9 sample reach, July 13, 2021.

Tributary Creek Site 1847

Site 1847 is located about 1.4 km downstream of the TDF at about 20 m elevation, and about 50 m upstream of the Tributary Creek mouth (Figure 10). We sampled periphyton and benthic macroinvertebrates 2018–2021 and compare the data to Site 9. We did not sample fish since Site 9 is preferred as the upstream sampling site for Dolly Varden char element concentration analyses.

Figure 10.—Tributary Creek Site 1847 sample reach, July 13, 2021.

METHODS

Data sets are reviewed annually to ensure accuracy and consistency with modifications to methods; corrections and updates are reported in the document and appendices. The most recent technical report presents the current data sets and should be used to analyze data from previous years.

WATER QUALITY

Basic water quality data (temperature, conductivity, and pH) were collected with a Hanna HI98194 multiparameter meter; the instrument was calibrated per the manufacturer's instructions prior to sampling.

STREAMFLOW

Sampling and Analysis

In Greens Creek, discharge was measured with a SonTek FlowTracker acoustic doppler velocimeter.ⁱ At least 20 measurement points were collected in equidistant subsections at a site where streamflow was confined to one channel and streambed elevation and streamflow exhibited uniformity; additional measurements were collected where changes in the streambed elevation and water velocity were observed. Following methods described in SonTek (2007), the survey began from either streambank along a measuring tape securely suspended across the stream—perpendicular to flow.

In Tributary Creek, discharge was measured with a collapsible 8 in. Cutthroat flume using methods described in CDPHE (2016).^j The flume was placed parallel to flow in a stream section confined to one channel with uniform flow, and the wing walls were spread upstream. The flume was leveled horizontally and vertically with a portable level and substrate was packed beyond the wing walls to direct all flow into the flume. Discharge was determined using charts provided by the manufacturer.

Data Presentation

Discharge measurements are presented for each site, including the daily mean discharge data obtained from USGS Site 15101490. Also presented is a figure of Greens Creek daily mean discharges three weeks prior to the sampling event, including daily mean discharges for the period three weeks prior to sampling events 2001–2020,^k and a figure presenting the range of Greens Creek daily mean discharges three weeks prior to sampling, 2001–2021.

ⁱ From 2010–2015, discharge in Greens Creek and Tributary Creek was estimated using a Global Flow Probe Model FP101 flow meter (Kanouse 2015) and a modification of the methods described in Platts et al. (1983).

^j From 2016 to 2018, and in 2020, Tributary Creek discharge was measured using a SonTek FlowTracker acoustic doppler velocimeter.

^k Discharge data are not available for Tributary Creek.

PERIPHYTON: CHLOROPHYLL DENSITY AND COMPOSITION

Periphyton is composed of primary producing organisms such as algae, cyanobacteria, heterotrophic microbes, and detritus attached to the submerged surfaces of aquatic ecosystems. Algal density and community structure are influenced by water and sediment characteristics through physical, chemical, and biological factors that change throughout the year (Barbour et al. 1999). The concentration of chlorophyll *a* (Chl-*a*) pigment in periphyton samples provides an estimate of active algal biomass (density), while concentrations of chlorophyll *b* (Chl-*b*) and chlorophyll *c* (Chl-*c*) pigments estimate the composition of algal organisms present, such as green algae that produce Chl-*b*, and diatoms and brown algae that produce Chl-*c*.

ADEC WMP 2.3.1.2.3 / IMP 5.3

The WMP requires measuring the density (mg/m^2) of chlorophylls *a*, *b*, and *c* in each periphyton sample, comparing the Greens Creek Site 48 and Site 63 Chl-*a* reference data to the Greens Creek Site 54 Chl-*a* data each year, and tracking change over time at each sample site. There are no reference data to compare Tributary Creek Site 9 or Site 1847 data.

Sample Collection and Analysis

Sampling methods are adapted from Barbour et al. (1999). Ten smooth, flat, undisturbed, and perennially wetted rocks were collected from riffle habitats in less than 0.45 m water depth at each sample site and submerged in the creek near the work area in the same orientation as initially collected. To collect a sample from each rock, a 5×5 cm square of high-density foam was held on the sample area; the area around the foam was scrubbed with a toothbrush to remove algae and other organisms outside the sample area. The rock was rinsed by submerging it in the stream while holding the foam in place; the toothbrush also was rinsed in the stream.

A 47 mm diameter Type A/E 1 μm glass fiber filter was placed into a Nalgene® filter receptacle attached to a vacuum pump with a gauge. The foam square was removed and the underside of the foam and the sample area were gently scrubbed in a circular pattern with the toothbrush into the filter receptacle. Stream water in a wash bottle was used to rinse loosened periphyton from the foam, rock, toothbrush, and the inside of the filter receptacle onto the filter. The sample area was scrubbed a second time and the rinse cycle was repeated. With most of the water pumped through the filter, maintaining pressure less than 34 kPa, a few drops¹ of saturated magnesium carbonate solution was added to the filter^m. The glass fiber filter was removed from the receptacle, folded in half with the sample inside, and wrapped in a white coffee filter for additional moisture absorption. The samples were placed in a sealed, labeled plastic bag with desiccant and stored in a light-proof cooler containing frozen icepacks during transportation; samples were stored in a -20°C freezer in the ADF&G Douglas laboratory until processing.

¹ This measurement is not exact as the amount of water and MgCO₃ used to create a saturated solution varies and does not affect sample integrity; supernatant solution was used to avoid MgCO₃ solids.

^m To prevent acidification and conversion of chlorophyll to phaeophytin.

U.S. Environmental Protection Agency (EPA; 1997) protocol was followed for chlorophyll extraction and measurement, determining instrument and estimated detection limits, and data analysis.ⁿ Samples were removed from the freezer, cut into small pieces, and placed into individual 15 mL screw cap centrifuge tubes containing 10 mL of 90% buffered acetone. The centrifuge tubes were capped and shaken to ensure complete submersion of the sample. Secured in a vial rack covered with aluminum foil to reduce light exposure, the samples were stored in a refrigerator for 12–24 hours to allow for saturation and chlorophyll extraction.

The samples were centrifuged for 20 min. at 500 relative centrifugal force. Prior to sample measurement, two cuvettes containing 90% buffered acetone were placed into a Shimadzu UV-1800 spectrophotometer to calibrate absorbance of the solvent at wavelengths 664 nm, 647 nm, 630 nm, and 750 nm. Each sample supernatant was decanted into an individual cuvette and absorbance was measured at each wavelength. Each sample was treated with 80 µL of 0.1 N hydrochloric acid for 90 seconds to convert the chlorophyll to phaeophytin, and absorbance was measured at wavelengths 665 nm and 750 nm. To minimize stray light and improve resolution, sample cuvettes were cleaned with a nonabrasive wipe prior to placement in the spectrophotometer.

Trichromatic equations were used to estimate Chl-*a*, Chl-*b*, and Chl-*c* densities, correcting for turbidity using the 750 nm absorbance value (APHA 2012, EPA 1997). Chl-*a* densities were corrected when phaeophytin was detected. Each year the estimated detection limit (EDL) is determined by analyzing seven replicate spinach dilution samples; the 2021 EDL for Chl-*a* concentration was 0.29 mg/m². When Chl-*a* was not detected in a sample, the concentration is reported as the spectrophotometer EDL and values for Chl-*b* and Chl-*c* are not reported.

To test for differences of mean densities between the 2021 Greens Creek Sites 63 and 54 data, the nonparametric Kruskal-Wallis one-way analysis of variance by ranks test (Neter et al. 1990) was performed using Statistix® 10 analytical software; significant differences are reported when $p \leq 0.05$. The Dunns all-pairwise comparison test also was performed to identify differences between sites.

Data Presentation

For each site and by year, mean Chl-*a* densities (mg/m²) \pm 1 SD are presented in a figure. Greens Creek Site 63 data is presented with Site 48; Tributary Creek Site 9 data is presented with Site 1847. Annual sample data and summaries are provided in Appendix A.

BENTHIC MACROINVERTEBRATE DENSITY AND COMMUNITY COMPOSITION

Benthic macroinvertebrates (BMI) classified in the orders Ephemeroptera (mayflies), Plecoptera (stoneflies), and Trichoptera (caddisflies), collectively known as EPT taxa, have complex and short life cycles and many genera are sensitive to changes in water and sediment quality (Barbour et al. 1999). These organisms are secondary producers, feed on periphyton and other macroinvertebrates, and are a food source for fish.

ⁿ Deviations from EPA (1997) include sample storage longer than 3.5 weeks, and cutting sample filters to reduce acetone exposure for laboratory staff (as opposed to homogenization).

ADEC WMP 2.3.1.2.4 / IMP 5.4

The WMP requires annually evaluating BMI abundance and community composition at each site. Mean BMI density and community composition are estimated at each site and compared with annual data among Greens Creek sites. There are no reference data to compare Tributary Creek Site 9 and Site 1847 data.

Sample Collection and Analysis

Eight BMI samples^o were collected from each site using a Hess stream bottom sampler in riffles and runs with gravel and cobble substrate and varying flow velocities—habitats that support greater BMI densities and taxonomic richness (Barbour et al. 1999). Other habitat types (e.g., pools) were excluded to reduce data variability.

The Hess stream bottom sampler has a 0.086 m² sample area and material is captured in a 200 mL cod end—both constructed with 300 µm mesh net. After securing the frame on the streambed with the opening facing the upstream current, rocks within the sample area were scoured with a scrub brush; gravel, sand, and silt were disturbed to about 10 cm depth to dislodge macroinvertebrates into the net. The net was rinsed in the stream to ensure all organisms drifted into the cod end, and each sample was transferred from the cod end to a labeled 500 mL plastic bottle. Samples were preserved in 95% ethanol at a ratio of three parts ethanol to one part sample. Samples exceeding the capacity of the cod end were discarded in the field to minimize detritus and substrate in samples and ensure proper sample preservation.

Entire samples were processed with an elutriator system with a 0.3 mm sieve to sort macroinvertebrates from debris^p and organisms were identified to the lowest practical taxonomic level^q using Merritt and Cummins (1996) and Stewart and Oswood (2006). Identification and enumeration were independently verified for five random samples.

BMI density was calculated for each sample by dividing the number of macroinvertebrates by 0.086 m²—the Hess sampling area. Mean density was estimated for each site by calculating the mean density among the eight samples. Taxa richness is reported as the number of taxonomic groups identified to the lowest practical level; terrestrial^r organisms were excluded from all calculations.

Data Presentation

For each site and by year, mean BMI density ± 1 SD and community composition are illustrated in figures. Greens Creek Site 63 data is presented with Site 48; Tributary Creek Site 9 data with Site 1847. Annual data summaries are provided in Appendix B.

^o Prior to 2015, we collected 5 BMI samples each year.

^p Gordon Willson-Naranjo and Greg Albrecht, Habitat Biologists, to Jackie Timothy, Southeast Regional Supervisor, ADF&G Division of Habitat. Memorandum: Benthic macroinvertebrate elutriation trials amendment; dated 12/17/2013. Unpublished document can be obtained from the Southeast Regional Supervisor, ADF&G Habitat Section, 802 3rd St, Douglas, AK.

^q Insects of the orders Ephemeroptera, Plecoptera, Trichoptera, and Diptera to genus, except nonbiting midges to family Chironomidae, and all others to class or order. Damaged and degraded organisms that cannot be identified are not reported.

^r Including adult terrestrial insects of the orders Ephemeroptera, Plecoptera, Trichoptera, and Diptera.

JUVENILE FISH ABUNDANCE AND CONDITION

Age, sex, season, maturation, diet, gut contents, fat reserve, and muscular development affect fish condition. Length and weight data were used to assess fish condition—an index of fish health.

ADEC WMP 2.3.1.2.1 / IMP 5.5

The WMP requires annual monitoring of abundance and condition of juvenile fish by species to detect variations at each site.

Sample Collection and Analysis

Following methods described in Magnus et al. (2006), two-piece 6.35 mm galvanized steel minnow traps baited with disinfected salmon roe^s were deployed throughout 50 m sample reaches isolated by natural features, such as shallow riffles and debris jams. In areas with high streamflow, rocks were added to the bottom of each trap for weight and to provide refuge for captured fish. Bait was contained in a punctured plastic bag to prevent ingestion and reduce the possibility of sample contamination. Prior to the study, several baited minnow traps were set within 15 m of the upstream and downstream sample reach boundaries to capture potential migrants and improve sample reach isolation.^t After the 1.5-hour trapping event, captured fish were transferred to a plastic bucket containing aerated stream water. Fish captured in the boundary traps were excluded from reported data. Ten Dolly Varden char were retained for whole body element concentration analyses at each sample site.

Biologists anesthetized fish using 9 mg/L^u AQUI-S® 20E (10% eugenol), measured and recorded FL to the nearest 1 mm, and species (Pollard et al. 1997). Fish weight was recorded to the nearest 0.1 g. During recovery, fish were retained in a perforated plastic bucket secured in the creek and released to the sample reach upon study completion.

Fulton's condition factor (K) was calculated using the equation given in Anderson and Neumann (1996), where the weight (W) of each fish is divided by the cubed length (L) of the fish, and the product multiplied by 100,000:

$$K = \frac{W}{L^3} \times 100,000$$

Data Presentation

Juvenile fish abundance and condition are compared by species for each site and year with data from the historical initial 1.5-hour trapping events and presented in figures.^v Greens Creek Site 63 data are presented with Site 48. Annual data summaries and length-frequency diagrams are provided in Appendix C.

^s 4 oz of Betadyne® was added to 3 gal of tap water to saturate roe for 15 min, stirring frequently.

^t Greens Creek discharge is usually too high to efficiently and effectively isolate sample reaches using a 6.35 mm (0.25 in) mesh net across the stream. Though a mesh net could effectively isolate the Tributary Creek Site 9 sample reach, baited minnow traps were used all years.

^u Dosage is 0.30 mL anesthetic per 1 gal. of stream water.

^v Prior to an approved modification of the IMP in 2020, estimating juvenile fish populations was required—achieved with a depletion sampling method involving three sequential 1.5-hour minnow trapping events.

JUVENILE FISH ELEMENT CONCENTRATIONS

ADEC WMP 2.3.1.2.2 / IMP 5.6

The WMP requires annual monitoring of whole body element concentrations in juvenile fish at Greens Creek Sites 63 and 54 and Tributary Creek Site 9 to assess element loading in aquatic communities near the mine. Element bioavailability and bioaccumulation depends on physical and chemical factors and interactions among biological communities (Tchounwou et al. 2012).

Sample Collection and Analysis

Wearing latex gloves, 10 juvenile Dolly Varden char from the abundance trapping event were retained in clean, labeled plastic bags.^{w,x} Fish retained were within the size range 85–125 mm FL;^y an 85 mm fish provides the minimum weight (about 5 g) required for laboratory analyses, while the maximum length of 125 mm improves the probability of excluding anadromous Dolly Varden char at Greens Creek Site 54 and Tributary Creek Site 9. FL and weight were measured, correcting for bag weight, and samples were stored in a cooler with ice packs during transportation to the ADF&G Douglas laboratory, where samples were stored in a -20°C freezer.

The samples were shipped in a cooler with ice packs to ALS Environmental in Kelso, WA, maintaining written chain of custody documentation. ALS Environmental individually digested, dried, and analyzed each sample for total silver (Ag), cadmium (Cd), copper (Cu), mercury^z (Hg), lead (Pb), selenium (Se), and zinc (Zn) on a dry weight basis following EPA (2002) method 1631E for Hg, and EPA (1998) method 6020A^{aa} for other elements. ALS Environmental provided Tier II quality control information, including results for matrix spikes, sample blanks, sample duplicates, and standard reference materials.

To test for differences of median element concentrations among Greens Creek sample sites, the nonparametric Kruskal-Wallis one-way analysis of variance by ranks test (Neter et al. 1990) was performed using Statistix® 10 analytical software; significant differences are reported when $p \leq 0.05$. The Dunns all-pairwise comparison test also was performed to identify differences between sites.

Data Presentation

For each sample site, a figure presents the minimum, median, and maximum of whole body concentrations (mg/kg) for each analyte by year.^{bb,cc} The annual raw data, presenting the mean value for duplicate sample results, and the 2021 laboratory report are provided in Appendix D.

^w Prior to 2015, six Dolly Varden char samples were collected at each site.

^x Due to scarcity of Dolly Varden char captured at Tributary Creek Site 9 2019–2021, some fish samples were collected beyond the sample reach, to achieve a minimum sample size of six fish.

^y To achieve a minimum sample size, in some years, retained fish samples measured less than the designated length range; when less than 85 mm, two fish were analyzed as a composite sample.

^z Annual analyses for Hg concentrations began in 2012; Hg data was incidentally received in 2010.

^{aa} EPA (1994) method 200.8 was used for analyses 2001–2010, 2012–2015, and 2018–2019.

^{bb} The 2011 samples were mistakenly homogenized, resulting in one data point for each element analysis.

^{cc} In 2012, laboratory contamination in several samples was suspected and these data were omitted in other publications (e.g., Legere and Timothy 2016).

RESULTS

Three weeks prior to sampling in 2021, Greens Creek daily mean discharges were generally above the 2001–2020 means (Figure 11). The median daily mean discharge during the three-week period was among the greatest observed (Figure 12).

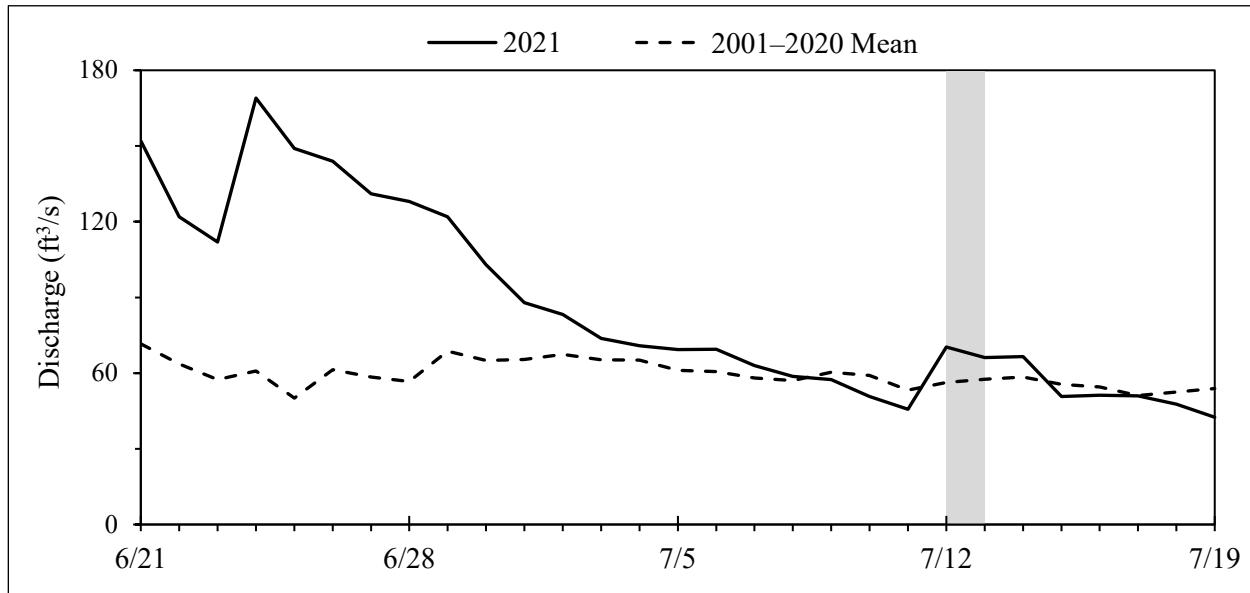

Figure 11.—Greens Creek daily mean discharge three weeks prior to sampling, 2021.

Source: USGS 15101490 (USGS 2022b).

Note: 2021 sampling days highlighted in gray (July 12, 13).

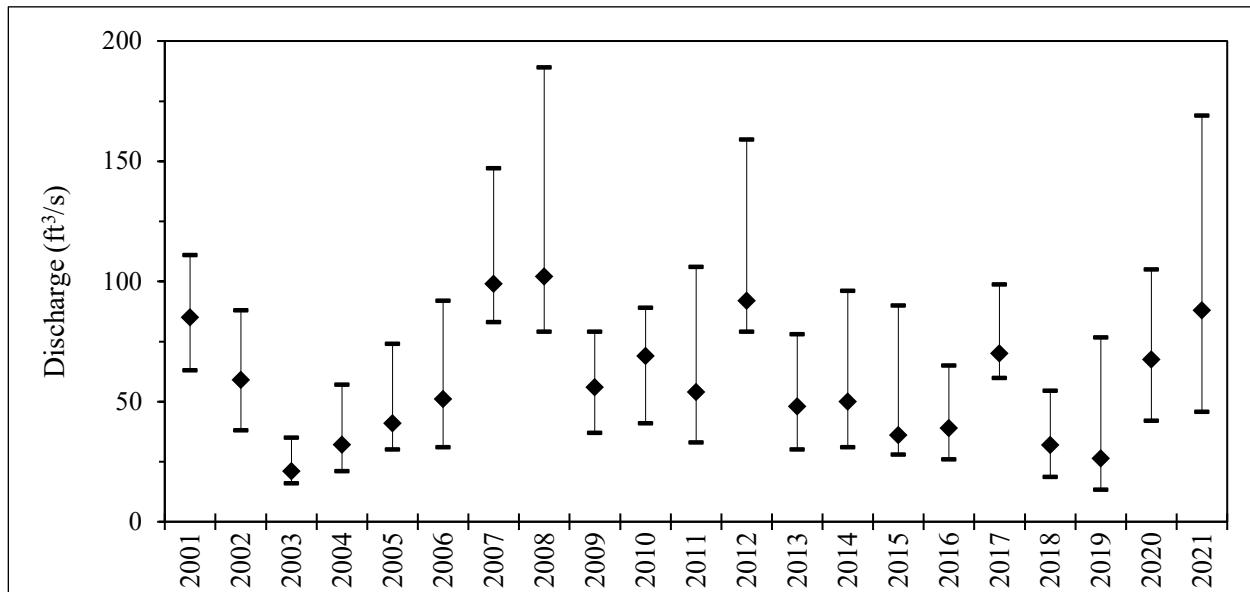

Figure 12.—Greens Creek daily mean discharge three weeks prior to sampling, 2001–2021.

Source: USGS 15101490 (USGS 2022b).

Note: Minimum, median, and maximum discharges presented.

GREENS CREEK SITE 48 AND SITE 63

We sampled Greens Creek Site 63 on July 12, 2021. Hecla environmental staff measured basic water quality at 1440 hours; we measured stream discharge at 1410 hours (Table 2). The USGS stream gage recorded a daily mean discharge of 70.3 ft³/s (USGS 2022).

Table 2.—Greens Creek Site 63 water quality data, 2021.

Sample Date	Temperature (°C)	Conductivity (µS/cm)	pH	Discharge (ft ³ /s)
07/21/21	7.4	80	8.1	89.43

Periphyton: Chlorophyll Density and Composition

The 2021 Site 63 mean Chl-*a* density was 2.65 mg/m²—lower than previously observed at Site 63 though similar to the 2020 mean, and among the lowest observed at Site 48 (Figure 13). The samples contained about 87% Chl-*a*, 13% Chl-*c*, and 0% Chl-*b*, similar to mean composition in previous years.

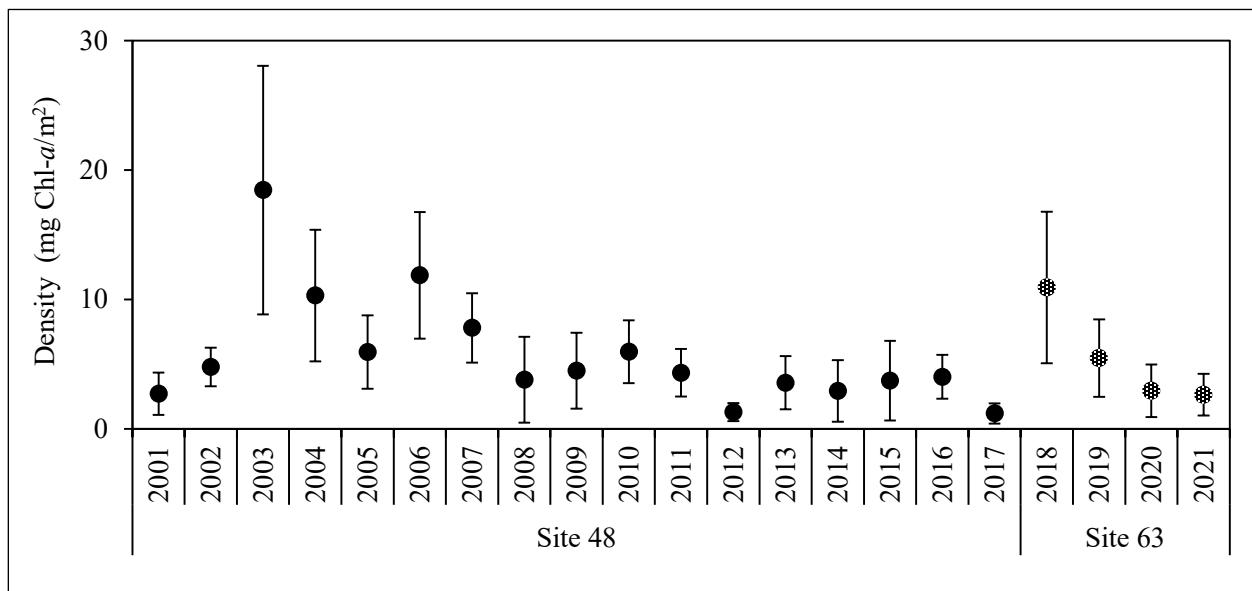

Figure 13.—Greens Creek Site 48 and Site 63 mean chlorophyll *a* densities \pm 1 SD, 2001–2021.

Benthic Macroinvertebrate Density and Community Composition

Among the 2021 BMI samples collected at Site 63, we counted 29 taxa—within the range previously observed at Sites 48 and 63. We estimate mean density at 1,391 BMI/m², with EPT insects composing 77% of the samples—among the lowest observed at both sites (Figures 14, 15). Dominant taxa were Ephemeroptera: *Baetis* and *Rhithrogena*, composing about 30% and 18% of the samples.

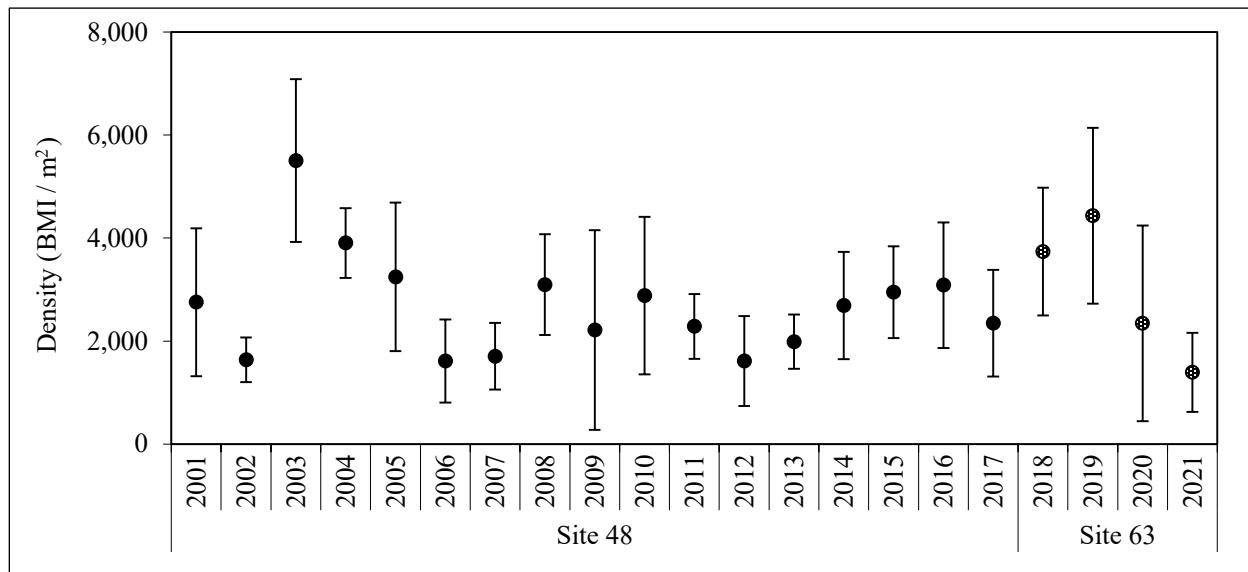

Figure 14.—Greens Creek Site 48 and Site 63 mean benthic macroinvertebrate densities \pm 1 SD, 2001–2021.

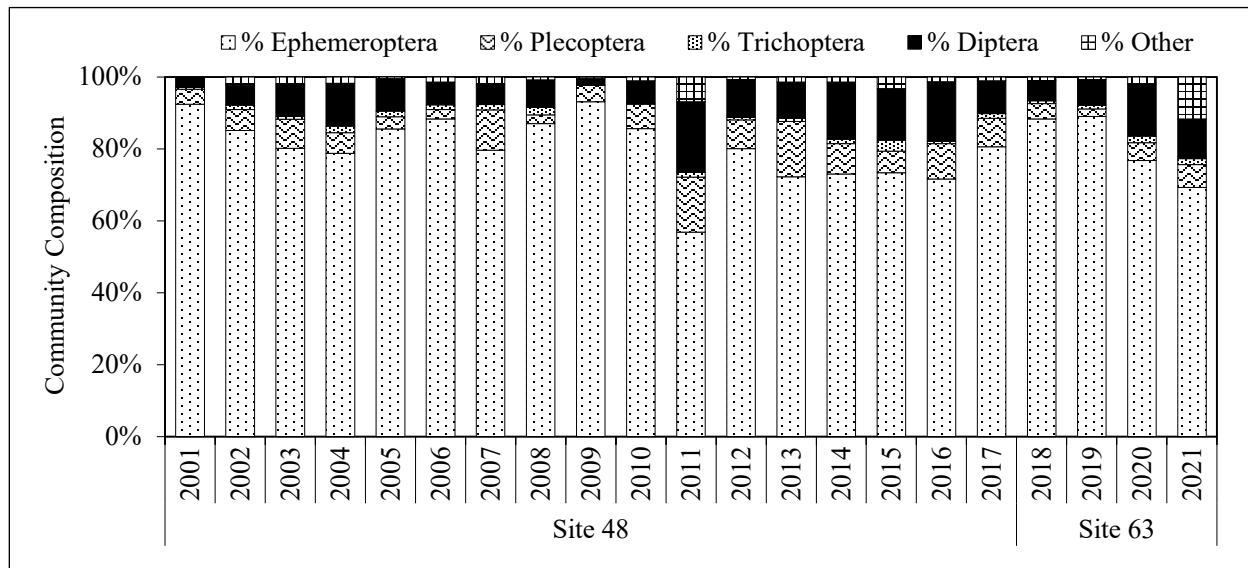

Figure 15.—Greens Creek Site 48 and Site 63 mean benthic macroinvertebrate community composition, 2001–2021.

Juvenile Fish Abundance and Condition

In 2021 at Site 63, we captured 36 Dolly Varden char—among the fewest fish captured in previous years during a single trapping event at Sites 48 and 63 (Figure 16). The mean fish condition factor among the Dolly Varden char captured was 1.0—within the range previously observed at Sites 48 and 63. The range of length frequencies observed suggests at least two age classes were present, as in previous years at Sites 48 and 63.

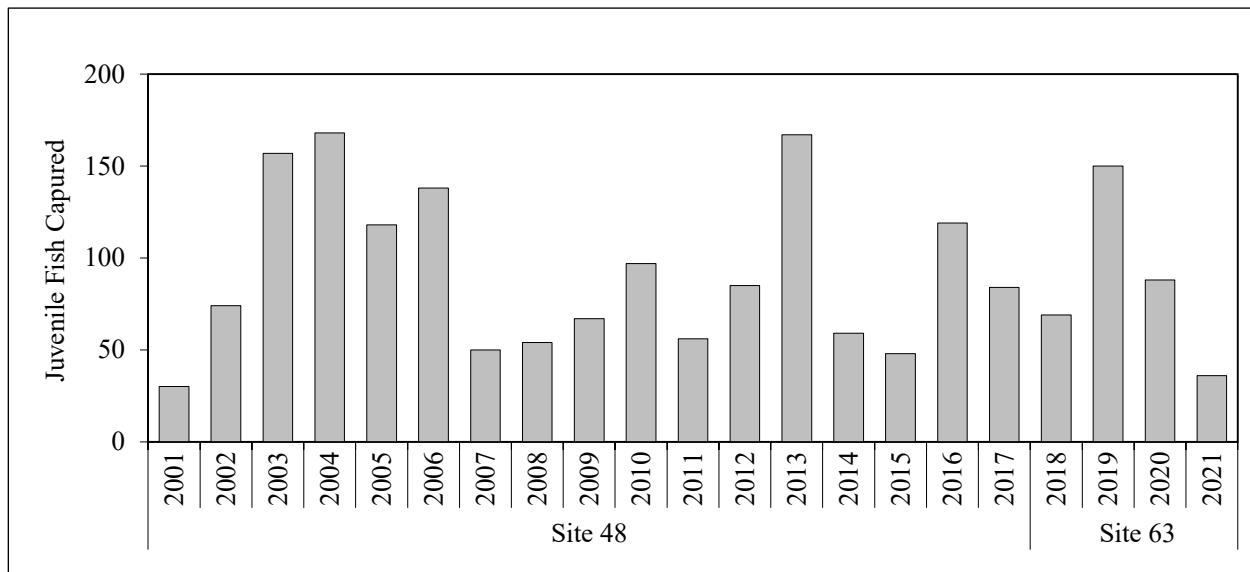

Figure 16.—Greens Creek Site 48 and Site 63 Dolly Varden char captured, 2001–2021.

Juvenile Fish Element Concentrations

Among the 2021 Site 63 whole body Dolly Varden char samples, all median element concentrations were within ranges previously observed at Sites 48 and 63 (Figures 17, 18).

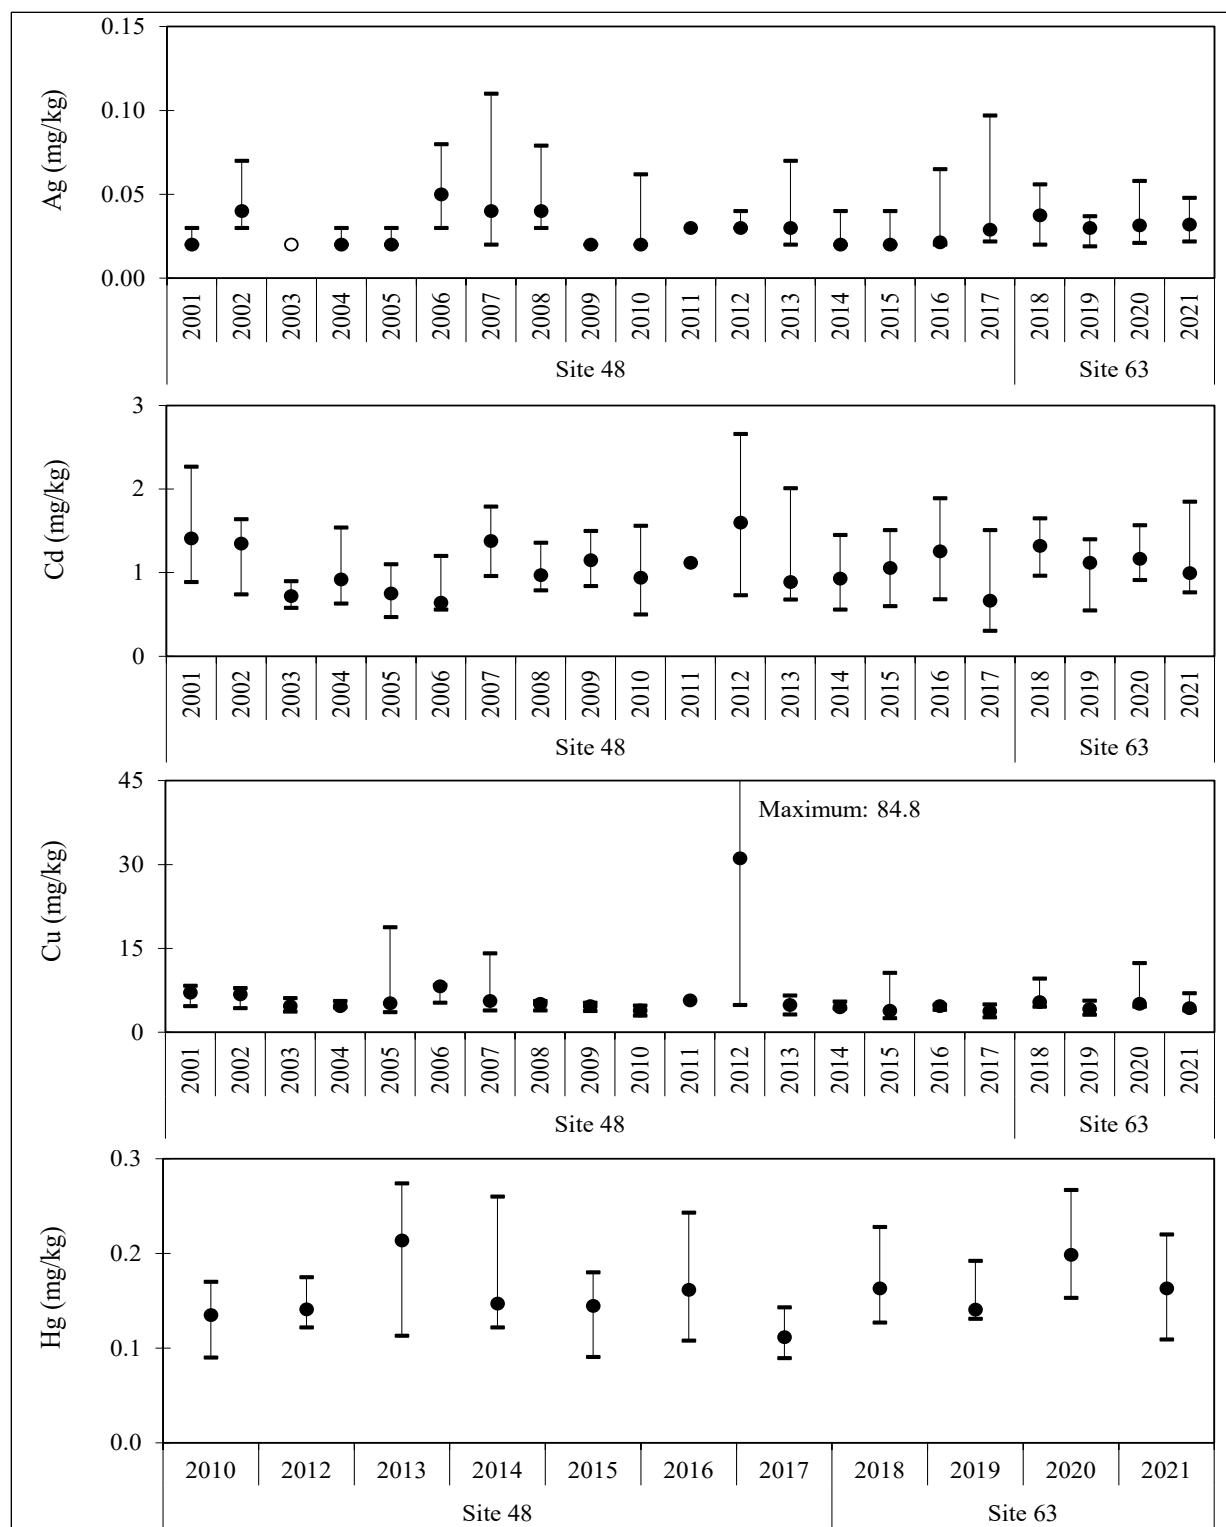

Figure 17.—Greens Creek Site 48 and Site 63 whole body Dolly Varden char Ag, Cd, and Cu concentrations, 2001–2021, and Hg concentrations, 2010, 2012–2021.

Note: Minimum, median, and maximum concentrations presented; element concentrations undetected (o) are presented at the method reporting limit.

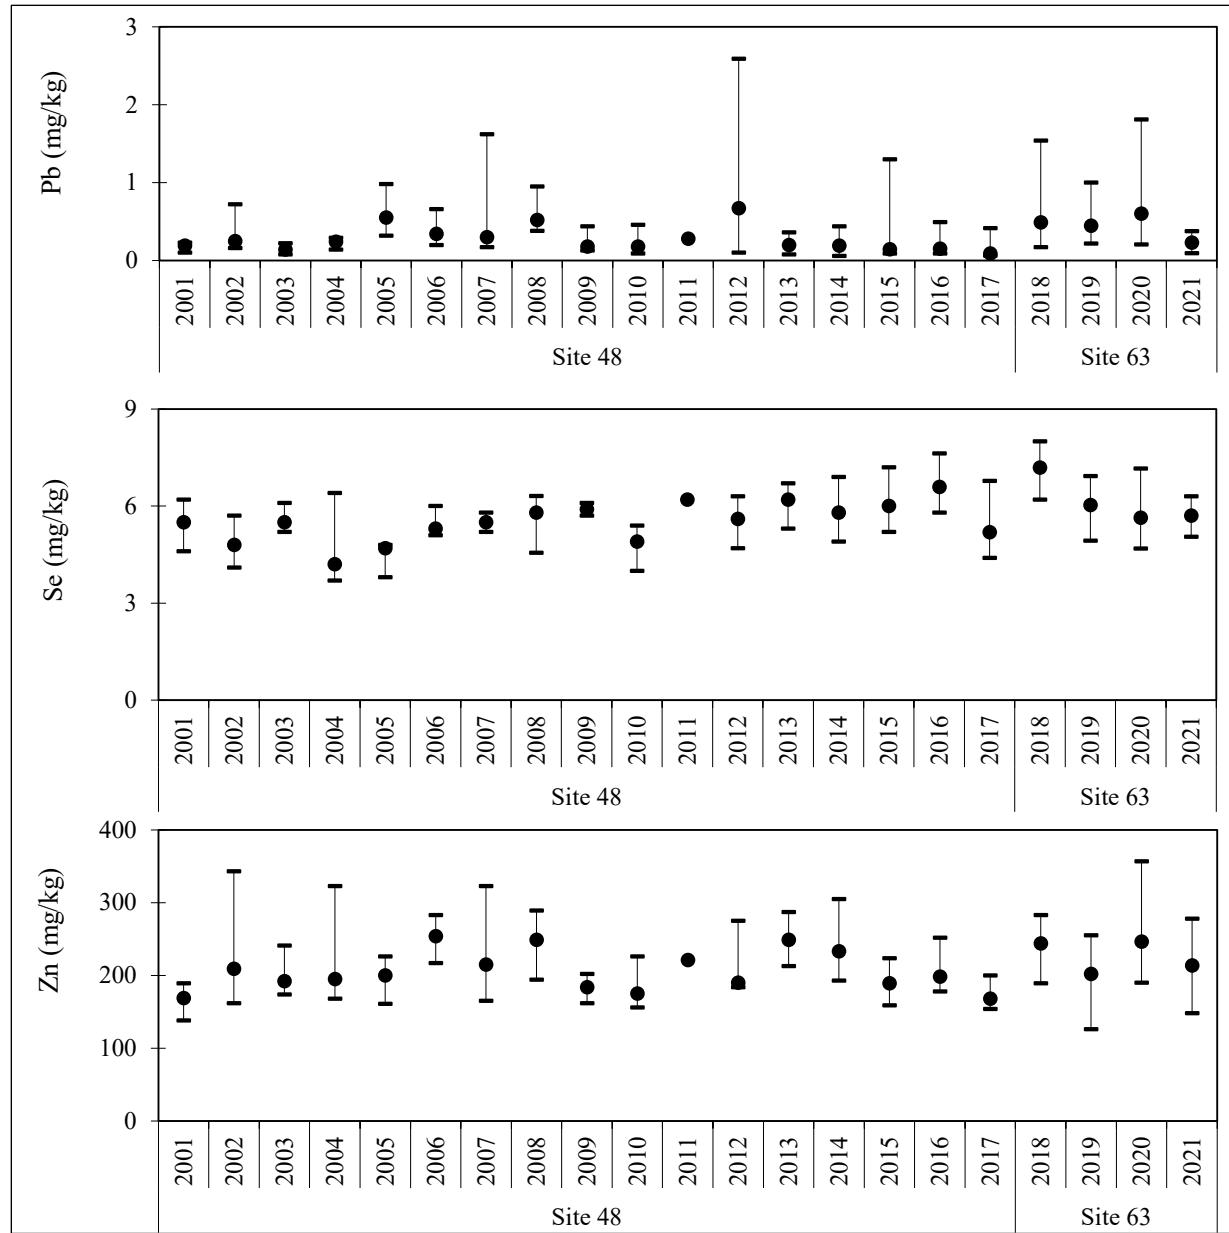

Figure 18.—Greens Creek Site 48 and Site 63 whole body Dolly Varden char Pb, Se, and Zn concentrations, 2001–2021.

Note: Minimum, median, and maximum concentrations presented.

GREENS CREEK SITE 54

We sampled Greens Creek Site 54 on July 12, 2021. Hecla environmental staff measured basic water quality at 0955 hours; we measured stream discharge at 1030 hours (Table 3). The USGS stream gage recorded a daily mean discharge of 70.3 ft³/s (USGS 2022).

Table 3.—Greens Creek Site 54 water quality data, 2021.

Sample Date	Temperature (°C)	Conductivity ($\mu\text{S}/\text{cm}$)	pH	Discharge (ft ³ /s)
07/12/21	7.3	90	7.7	76.10

Periphyton: Chlorophyll Density and Composition

The 2021 Site 54 mean Chl-a density was 1.79 mg/m²—among the lowest previously observed (Figure 19). The samples contained about 89% Chl-a, 11% Chl-c, and 0% Chl-b, similar to mean composition in previous years.

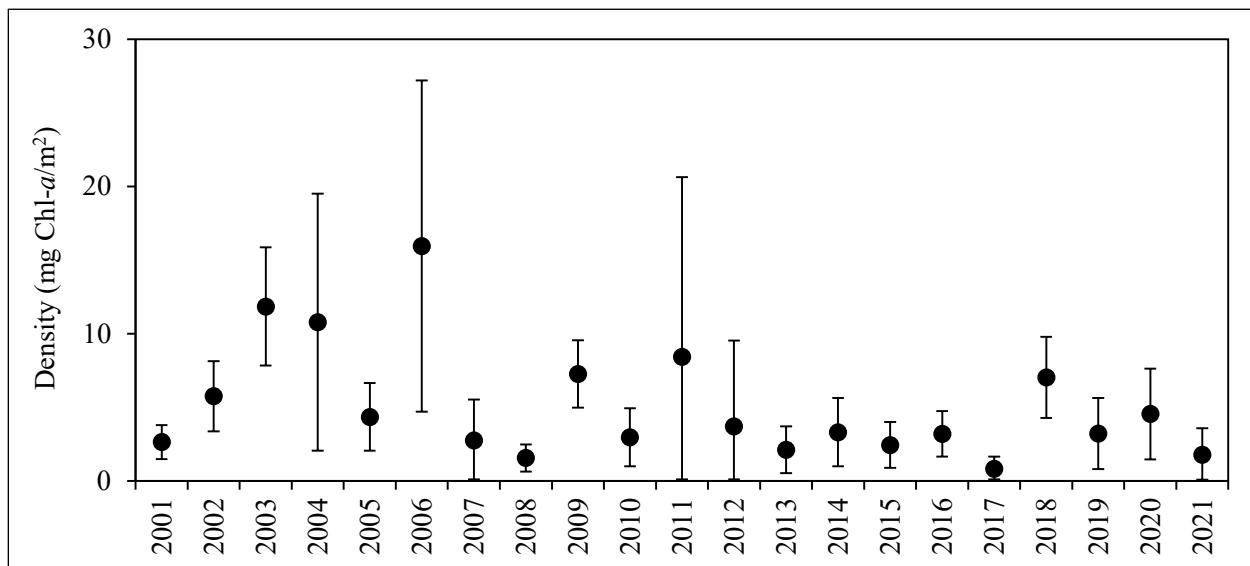

Figure 19.—Greens Creek Site 54 mean chlorophyll a densities ± 1 SD, 2001–2021.

Benthic Macroinvertebrate Density and Community Composition

Among the 2021 BMI samples collected at Site 54, we counted 24 taxa and estimate mean density at 1,068 BMI/m², with EPT insects composing 83% of the samples—all among the lowest previously observed (Figures 20, 21). The dominant taxon was Ephemeroptera: *Baetis*, composing about 45% of the samples.

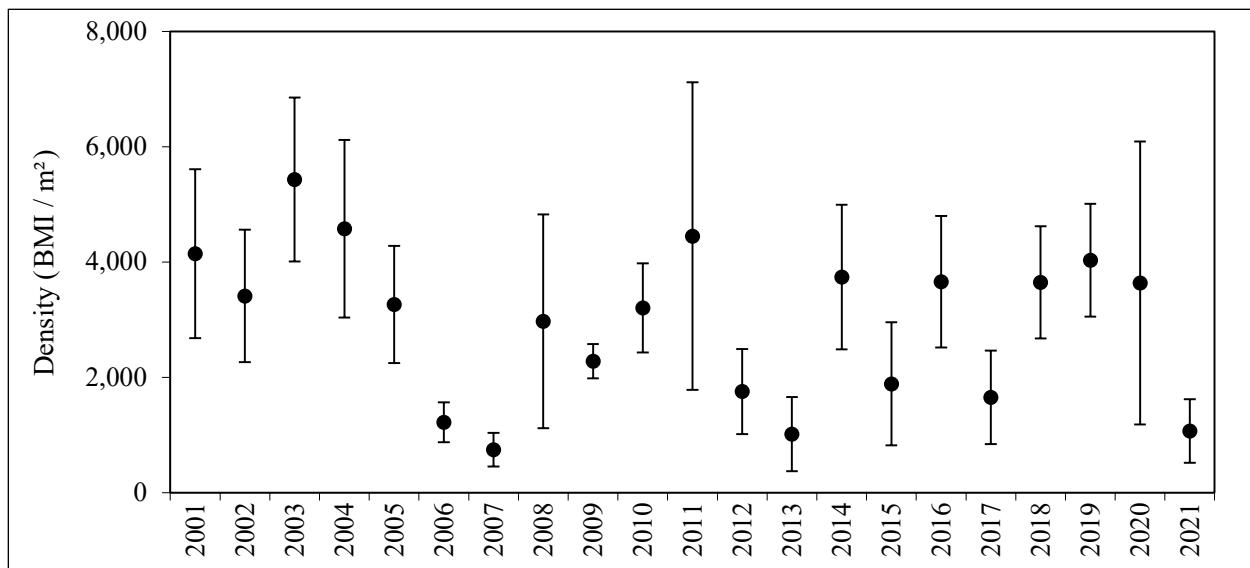

Figure 20.—Greens Creek Site 54 mean benthic macroinvertebrate densities \pm 1 SD, 2001–2021.

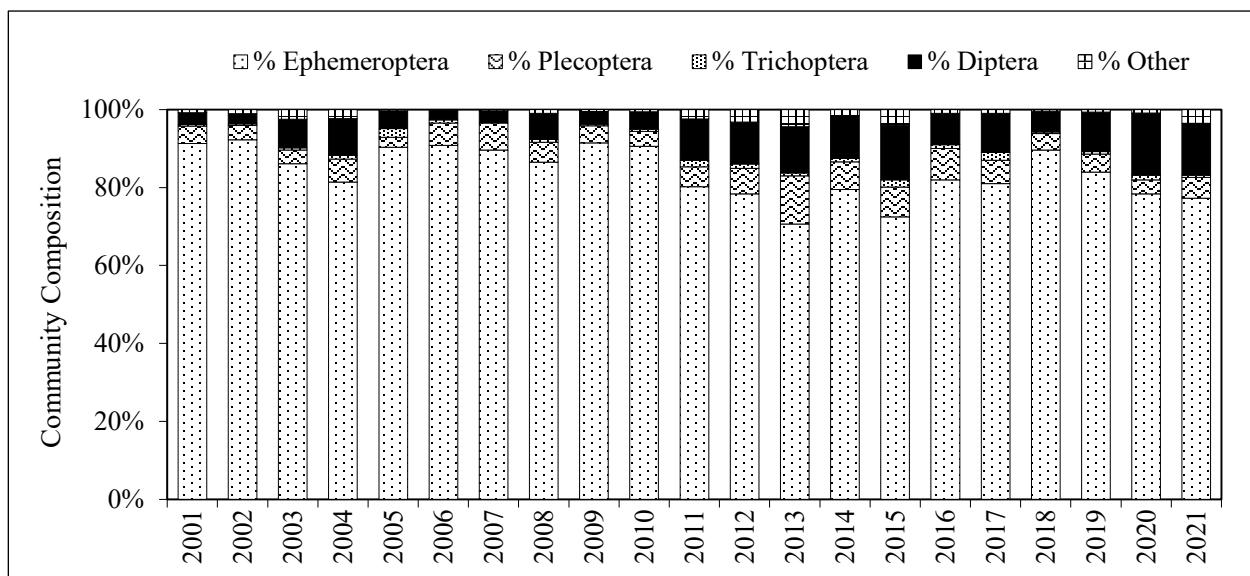

Figure 21.—Greens Creek Site 54 mean benthic macroinvertebrate community composition, 2001–2021.

Juvenile Fish Abundance and Condition

In 2021 at Site 54, we captured 74 Dolly Varden char and 1 juvenile coho salmon (63 mm FL)^{dd}—within the range of both species captured in previous years during a single trapping event (Figure 22). The mean fish condition factor for Dolly Varden char was 1.0; the fish condition factor of the juvenile coho salmon was 1.5. The range of length frequencies observed for Dolly Varden char suggests multiple age classes were present, as in previous years.

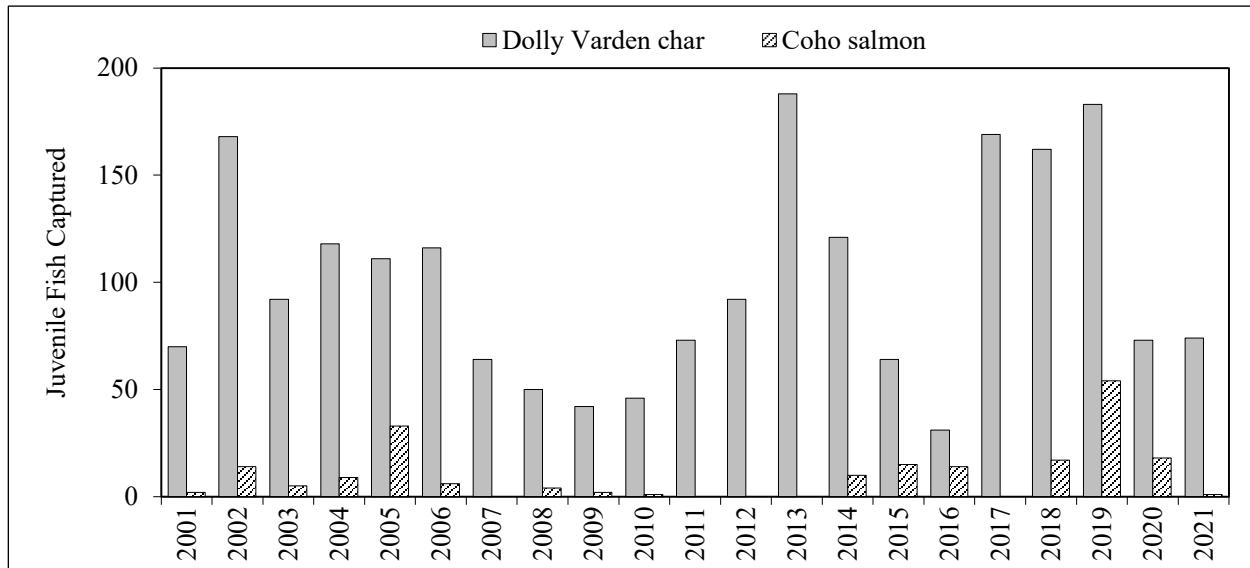

Figure 22.—Greens Creek Site 54 juvenile fish captured, 2001–2021.

Note: 2001–2010 data were from a 28 m reach, while 2011–2021 data from a 50 m reach. Species other than Dolly Varden char and coho salmon are not illustrated.

Juvenile Fish Element Concentrations

Among the 2021 Site 54 whole body Dolly Varden char samples, all median element concentrations were within ranges previously observed (Figures 23, 24).

^{dd} During historical sampling events, juvenile coho salmon were occasionally observed within the sampling reach while none were captured (Zutz 2017); no additional juvenile coho salmon were observed in 2021.

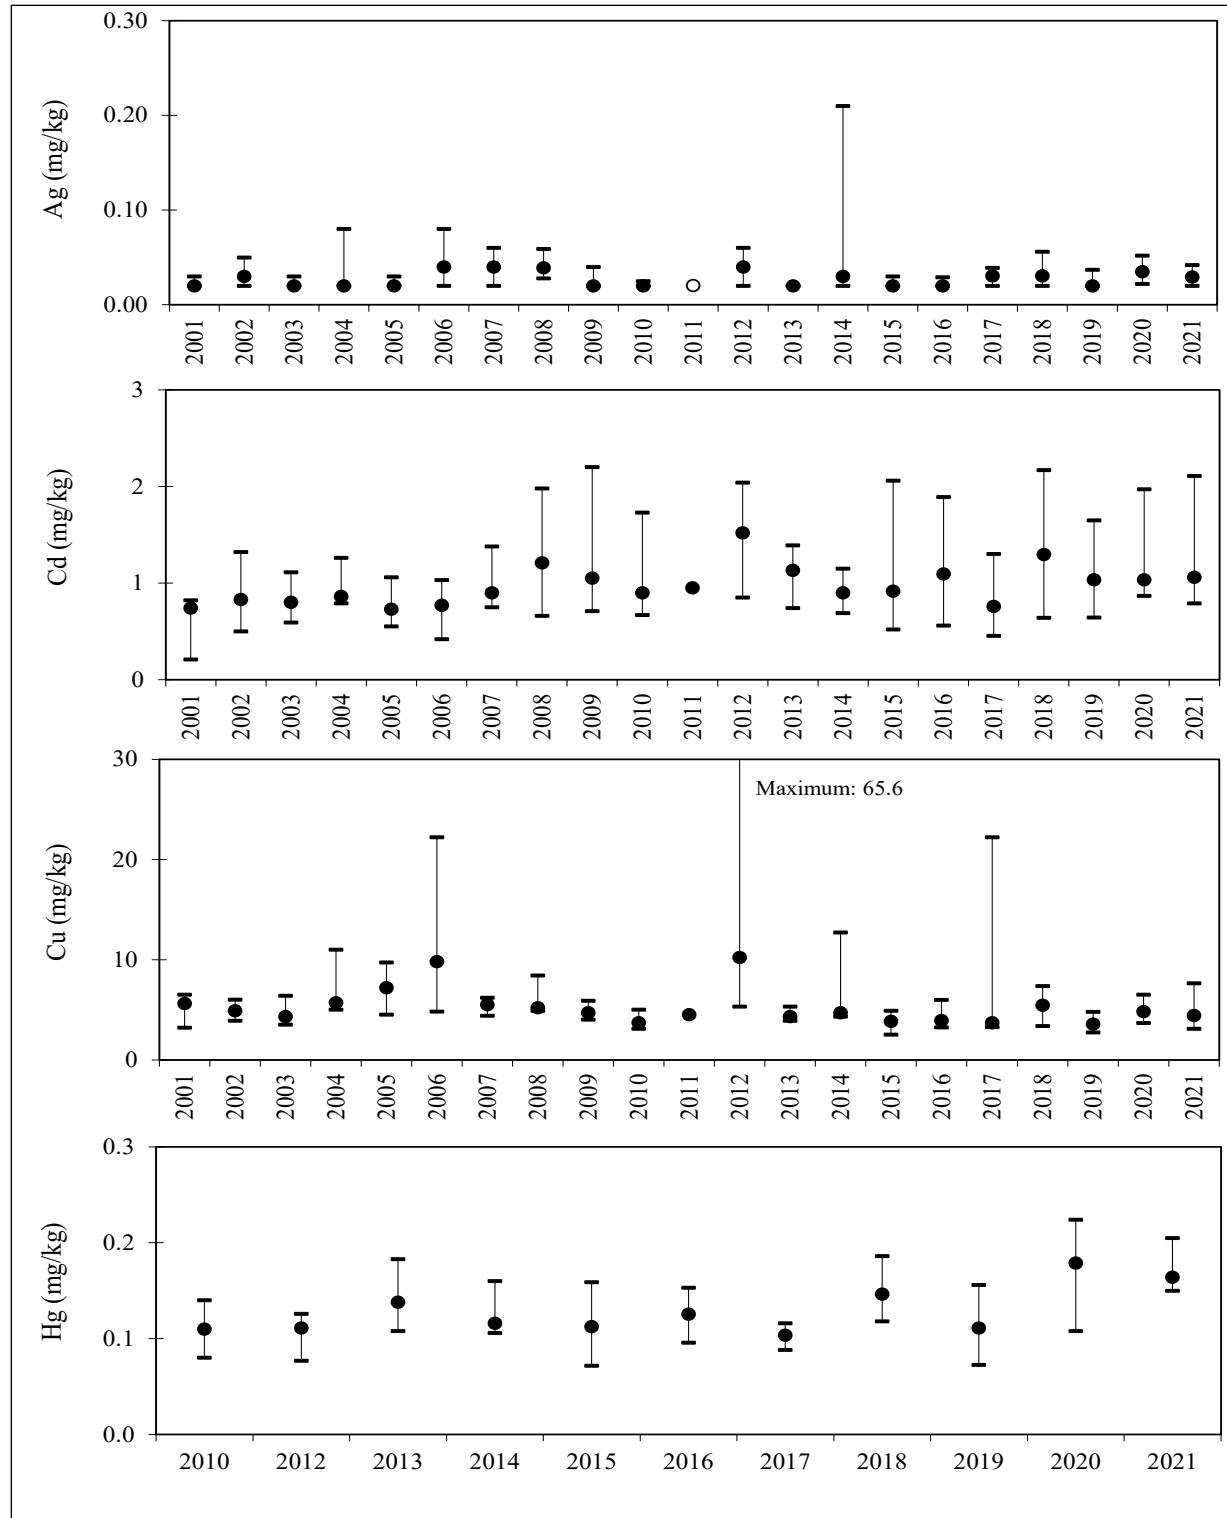

Figure 23.—Greens Creek Site 54 whole body Dolly Varden char Ag, Cd, and Cu concentrations, 2001–2021, and Hg concentrations, 2010, 2012–2021.

Note: Minimum, median, and maximum concentrations presented; element concentrations undetected (o) are presented at the method reporting limit.

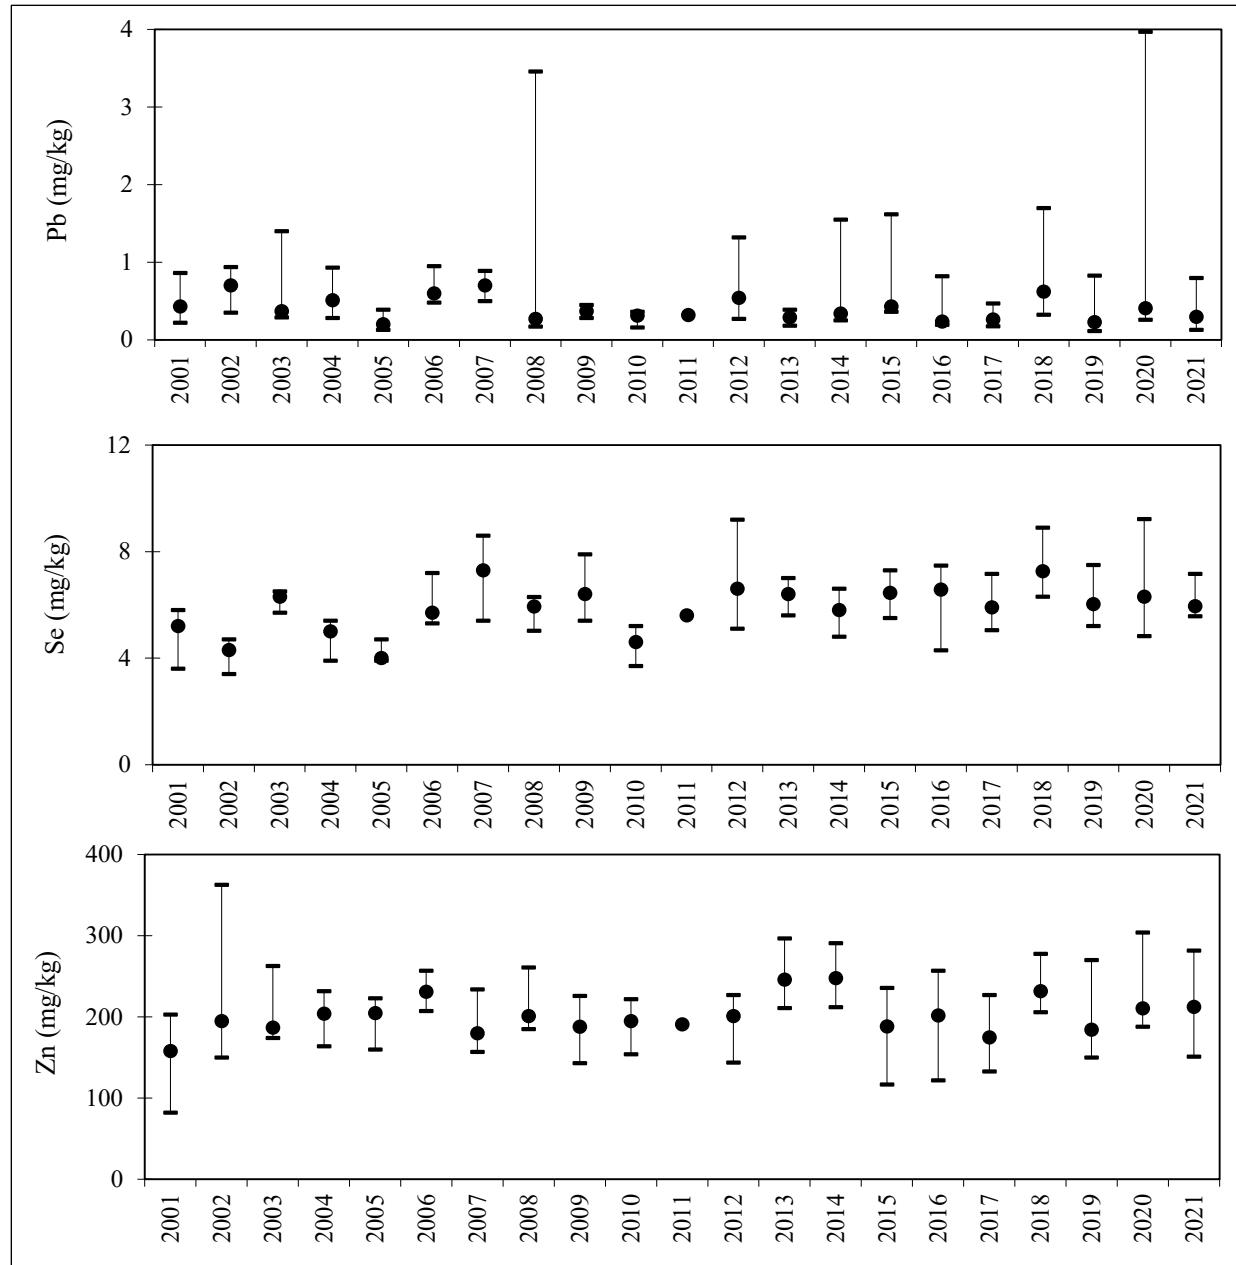

Figure 24.—Greens Creek Site 54 whole body Dolly Varden char Pb, Se, and Zn concentrations, 2001–2021.

Note: Minimum, median, and maximum concentrations presented.

TRIBUTARY CREEK SITE 9 AND SITE 1847

We sampled Tributary Creek Sites 9 and 1847 on July 13, 2021. At Site 9, we measured stream discharge at 1100 hours and basic water quality at 1230 hours. At Site 1847, we measured discharge at 1315 hours and water quality at 1325 hours (Table 4).

Table 4.—Greens Creek Sites 9 and 1847 water quality data, 2021.

Sample Date	Sample Site	Temperature (°C)	Conductivity ($\mu\text{S}/\text{cm}$)	pH	Discharge (ft ³ /s)
07/13/21	9	12.5	73	7.7	0.20
07/13/21	1847	12.2	75	7.3	0.38

Periphyton: Chlorophyll Density and Composition

At Site 9, the 2021 mean Chl-*a* density was 5.99 mg/m²—within the range previously observed (Figure 25). The samples contained about 94% Chl-*a*, 5% Chl-*c*, and 1% Chl-*b*, similar to mean composition in previous years.

At Site 1847, the 2021 mean Chl-*a* density was 9.52 mg/m²—greater than previously observed (Figure 25). The samples contained about 93% Chl-*a*, 7% Chl-*c*, and zero Chl-*b*, similar to the mean composition 2018–2020.

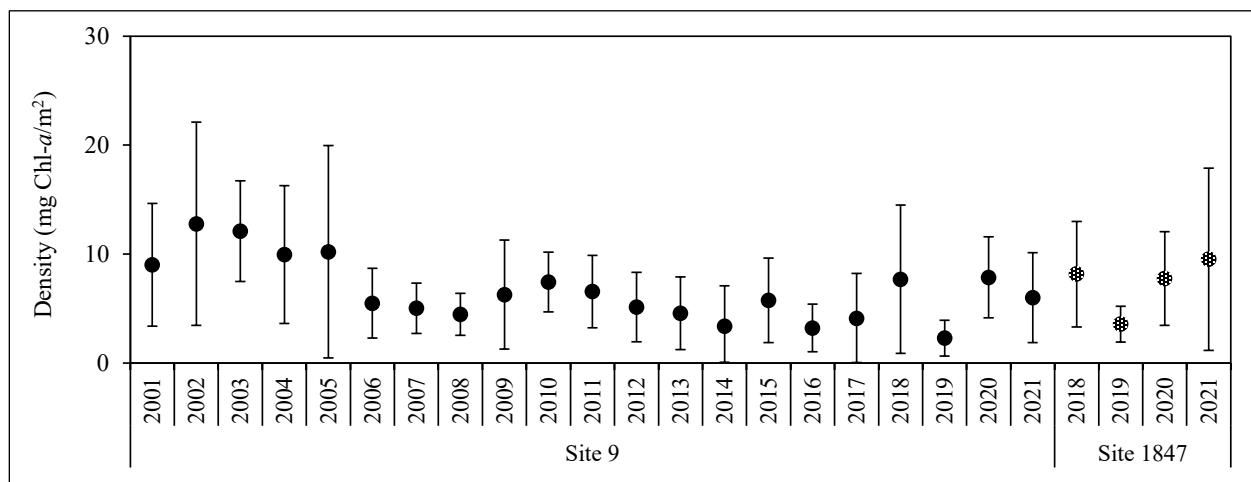

Figure 25.—Tributary Creek Site 9 and Site 1847 mean chlorophyll *a* densities \pm 1 SD, 2001–2021.

Benthic Macroinvertebrate Density and Community Composition

Among the 2021 BMI samples collected at Site 9, we counted 28 taxa and estimate mean density at 2,304 BMI/m² with EPT insects composing 40% of the samples—all within ranges previously observed (Figures 26, 27). Dominant taxa were Diptera: Chironomidae and Plecoptera: *Zapada*, composing about 36% and 19% of the samples.

Among the 2021 BMI samples collected at Site 1847, we counted 25 taxa—the lowest observed; we estimate mean density at 2,860 BMI/m² with EPT insects composing 68% of the samples—both within the ranges previously observed (Figures 26, 27). Dominant taxa were Ephemeroptera: *Cinygmulia* and Diptera: Chironomidae, composing about 33% and 16% of the samples.

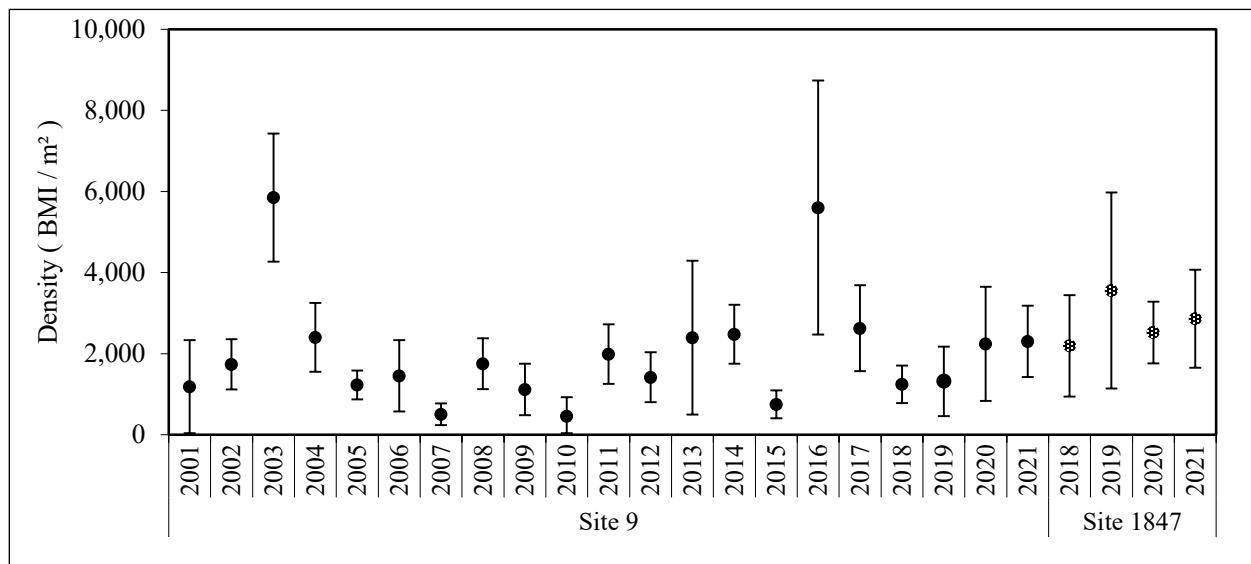

Figure 26.—Tributary Creek Site 9 and Site 1847 mean benthic macroinvertebrate densities \pm 1 SD, 2001–2021.

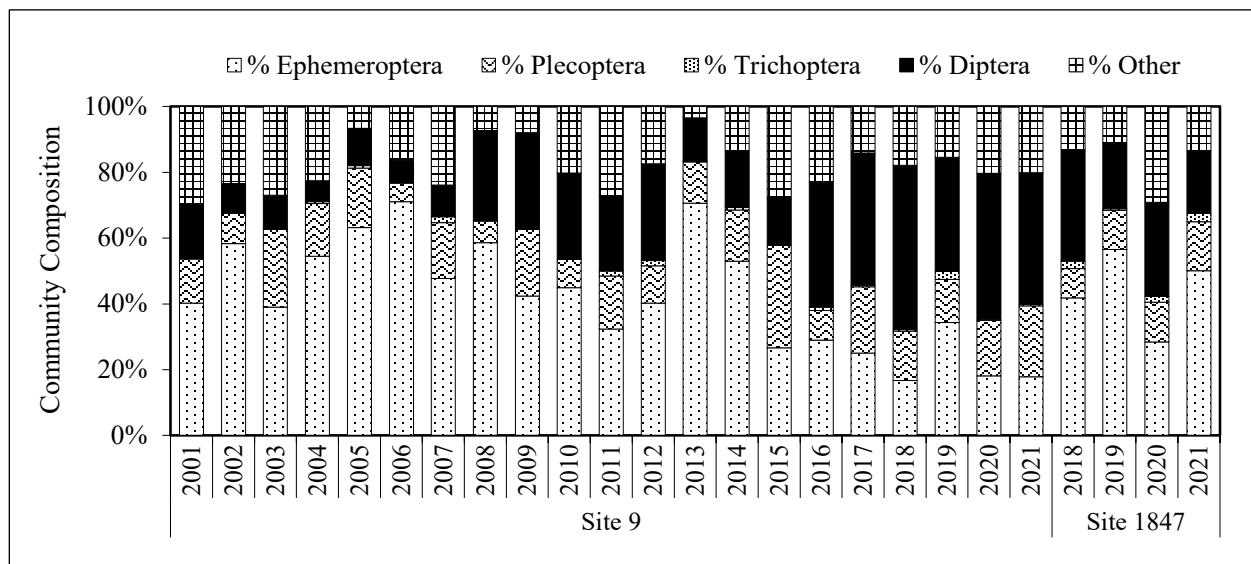

Figure 27.—Tributary Creek Site 9 and Site 1847 mean benthic macroinvertebrate community composition, 2001–2021.

Juvenile Fish Abundance and Condition

In 2021 at Site 9, we captured 5 Dolly Varden char and 70 juvenile coho salmon—within the range observed in previous years during a single trapping event (Figure 28). The mean fish condition factors were 1.1 for Dolly Varden char and 1.2 for coho salmon. The range of length frequencies observed suggests one age class of Dolly Varden char and two age classes of coho salmon were present.

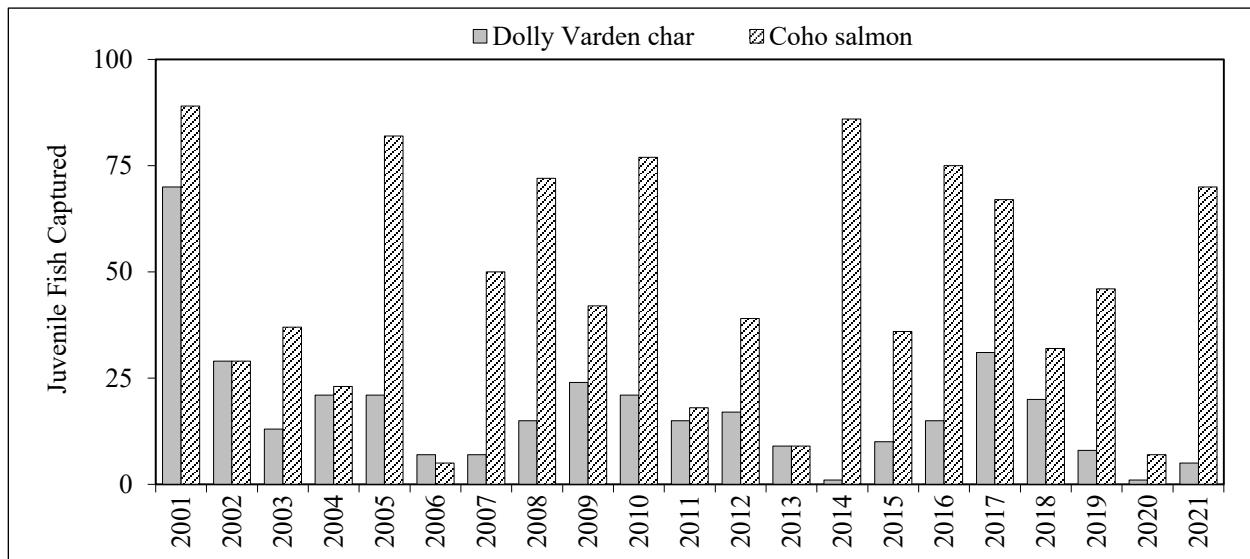

Figure 28.—Tributary Creek Site 9 juvenile fish captured, 2001–2021.

Juvenile Fish Element Concentrations

Among the eight whole body Dolly Varden char samples collected at Site 9 in 2021,^{ee} all median element concentrations were within ranges previously observed; the range of Zn concentrations was greater than previously observed (Figures 29, 30).

^{ee} Due to scarcity of Dolly Varden char captured at Tributary Creek Site 9 in 2021, seven samples were collected upstream and downstream of the sample reach, as in previous years when necessary to achieve a minimum sample size of six fish.

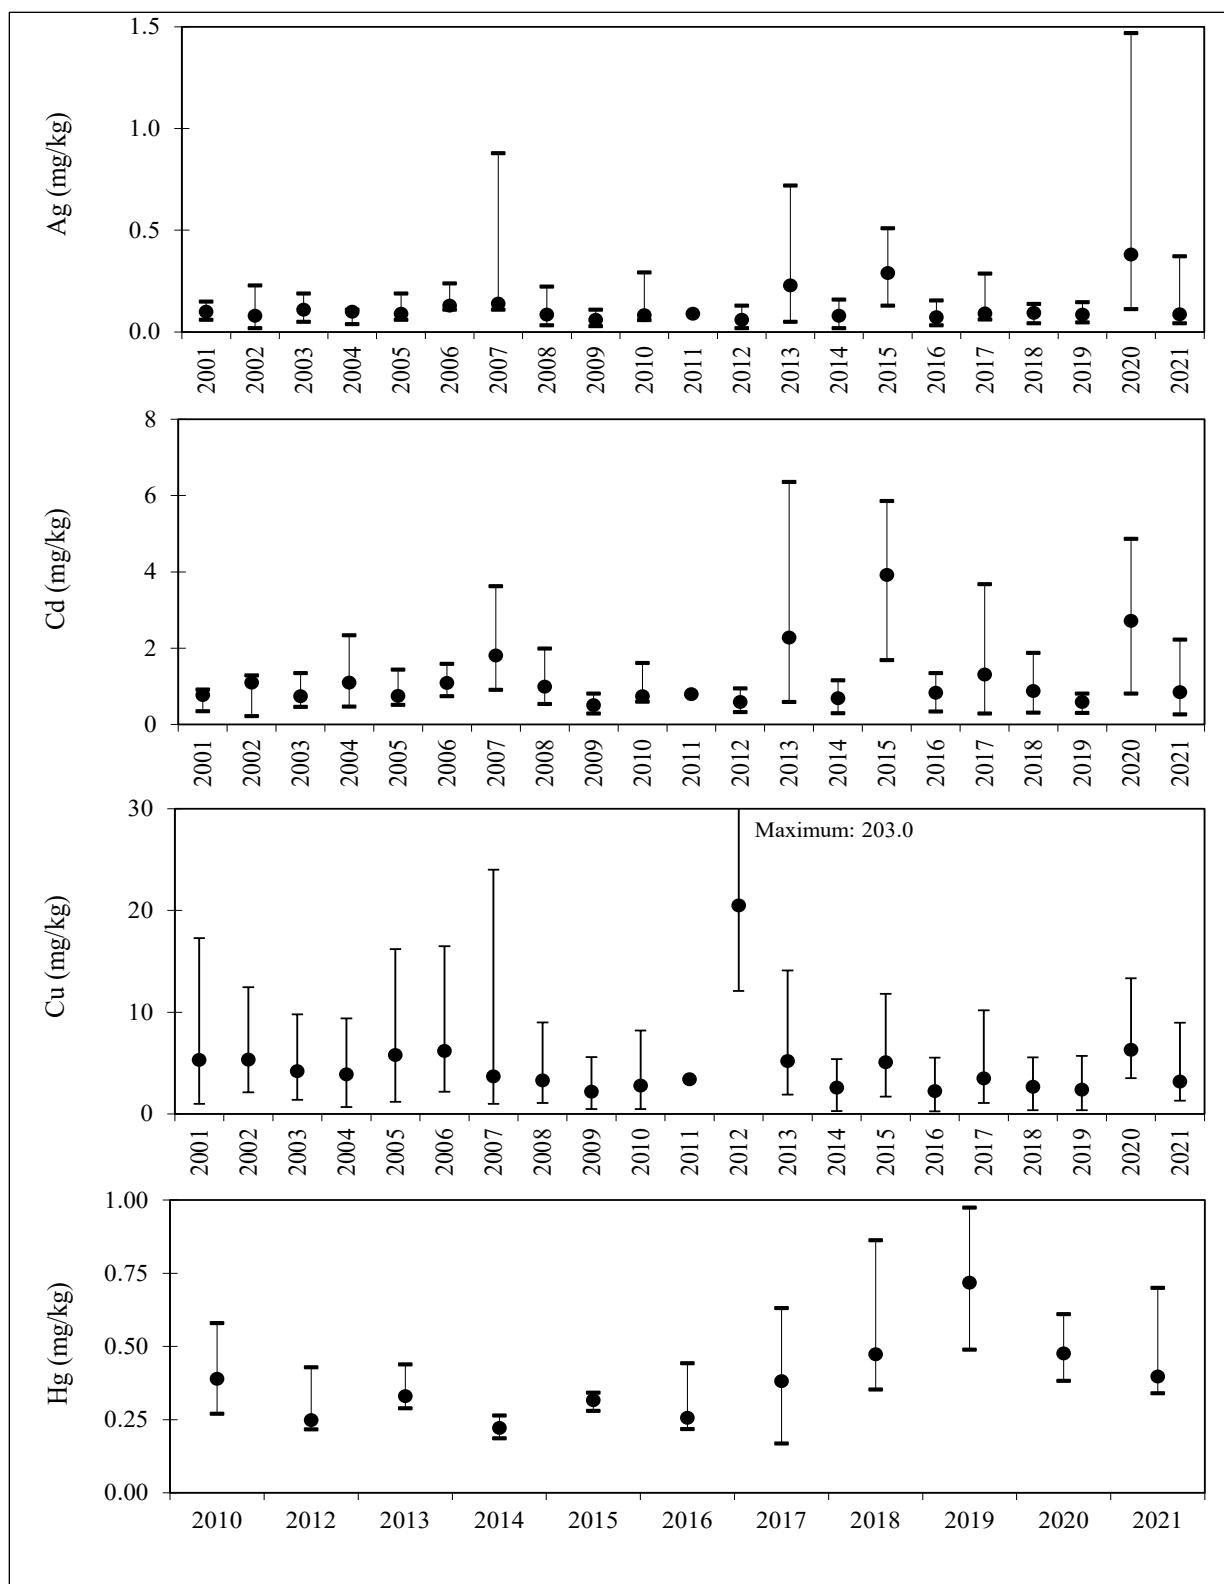

Figure 29.—Tributary Creek Site 9 whole body Dolly Varden char Ag, Cd, and Cu concentrations, 2001–2021, and Hg concentrations, 2010, 2012–2021.

Note: Minimum, median, and maximum concentrations presented.

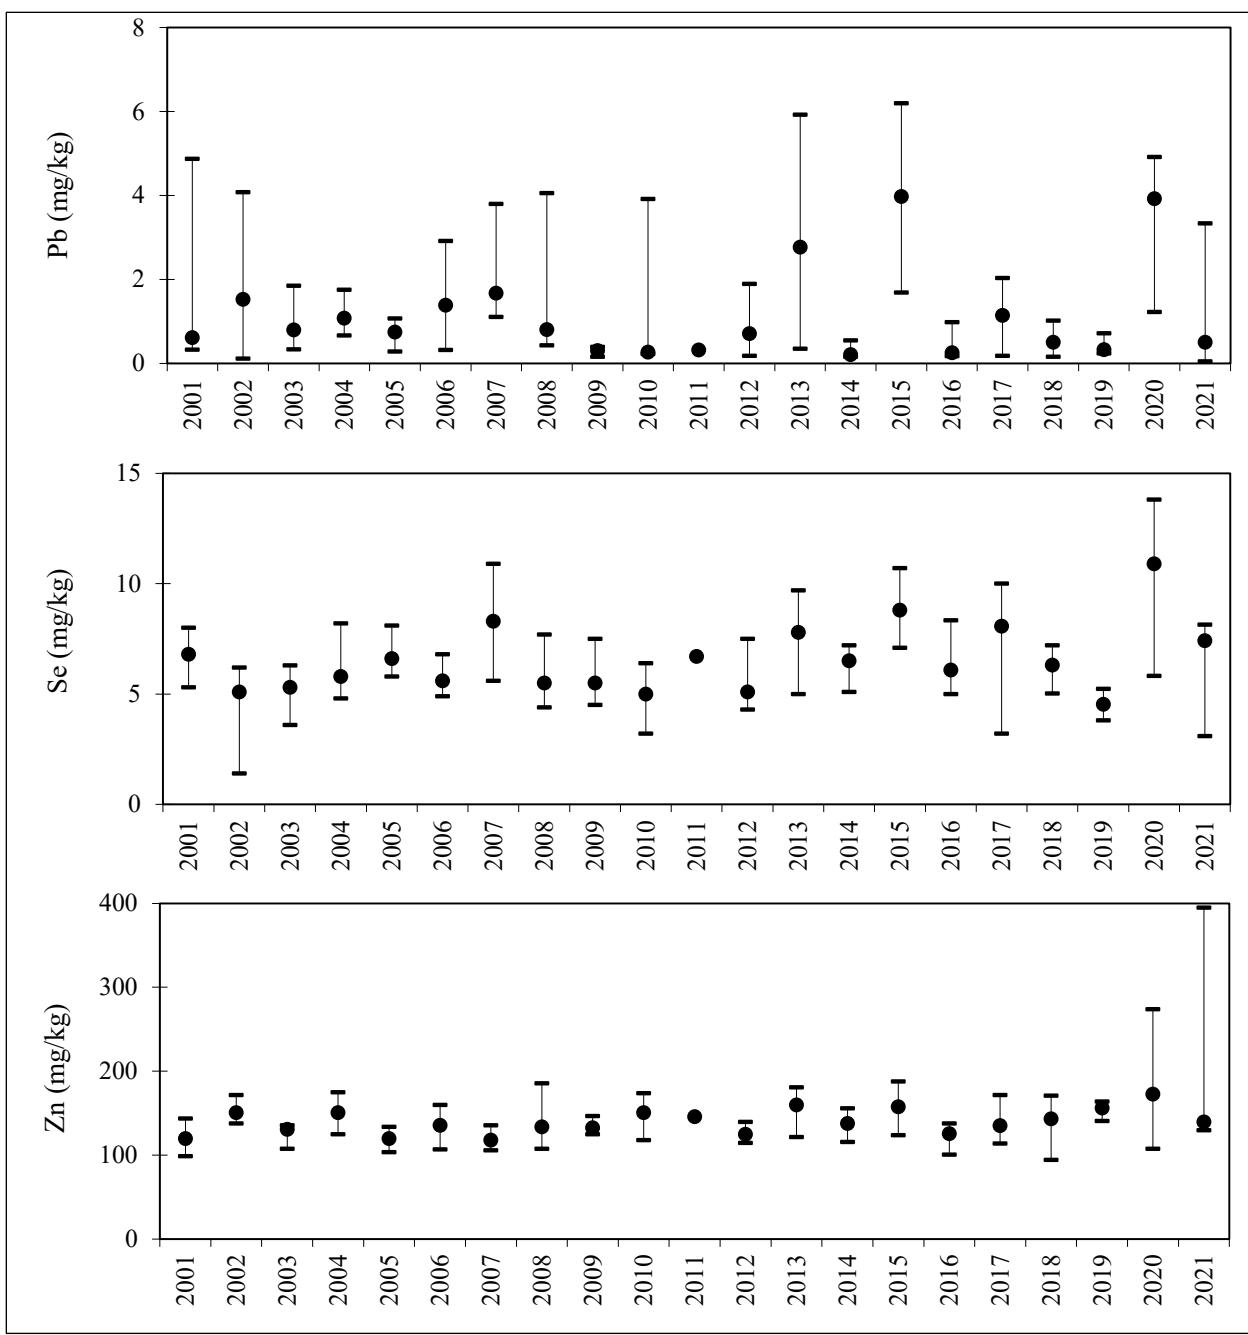

Figure 30.—Tributary Creek Site 9 whole body Dolly Varden char Pb, Se, and Zn concentrations, 2001–2021.

Note: Minimum, median, and maximum concentrations presented.

COMPARISONS AMONG GREENS CREEK SITES

Periphyton: Chlorophyll Density and Composition

In 2021, the mean Chl-*a* density at Site 63 (2.65 mg/m^2) was significantly greater than observed at Site 54 (1.79 mg/m^2). Mean Chl-*a* densities at Sites 48 and 63 and Site 54 generally followed a similar trend 2001–2021 (Figure 31). Periphyton samples collected at all Greens Creek sites generally contained about 90% Chl-*a*, nearly 0% Chl-*b*, and 10% Chl-*c* each year.

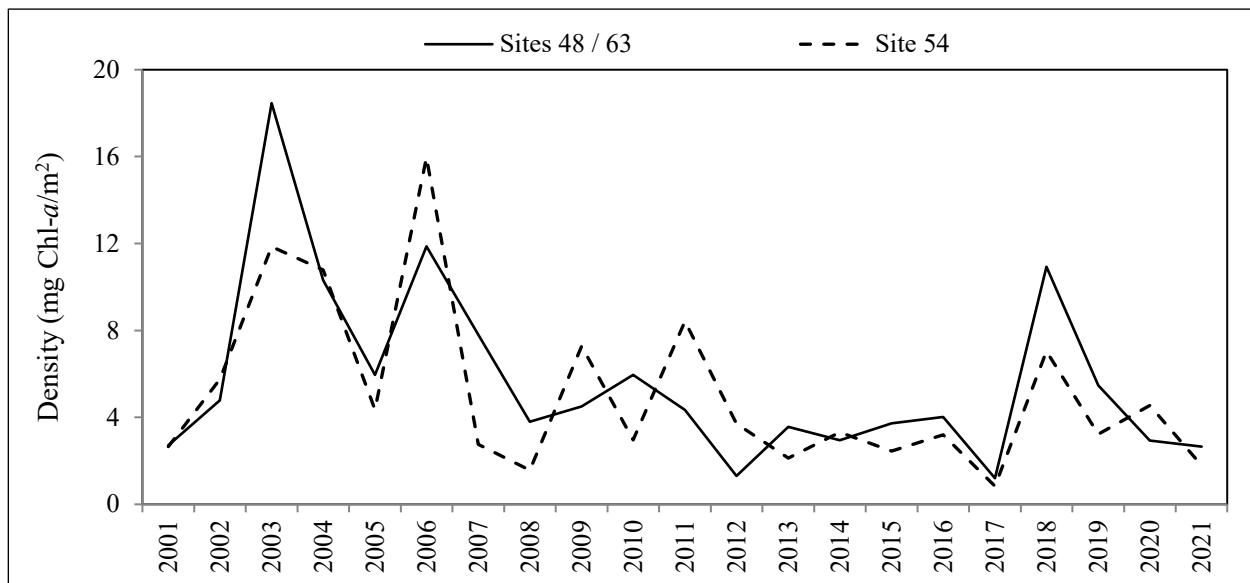

Figure 31.—Greens Creek mean chlorophyll *a* densities, 2001–2021.

Note: Site 48 data collected 2001–2017, and Site 63 data collected 2018–2021.

Benthic Macroinvertebrate Density and Community Composition

From 2001 through 2021, we observed generally similar trends of mean benthic macroinvertebrate density and taxonomic richness among both Greens Creek sample sites (Figures 32, 33). EPT insects usually composed about 90% of samples at each site.

Figure 32.—Greens Creek mean benthic macroinvertebrate densities, 2001–2021.

Note: Site 48 data collected 2001–2017; Site 63 data collected 2018–2021.

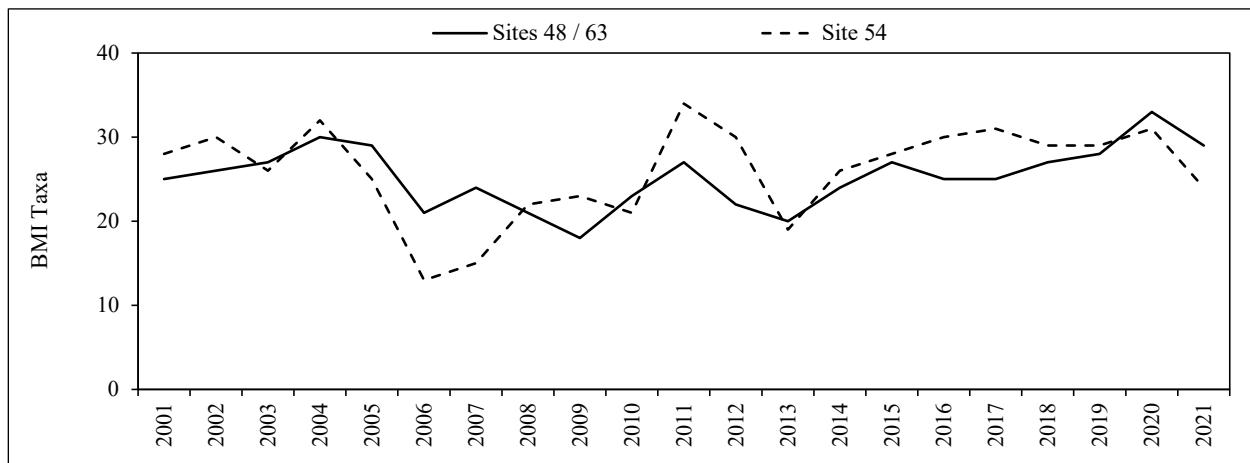

Figure 33.—Greens Creek benthic macroinvertebrate taxa richness, 2001–2021.

Note: Site 48 data collected 2001–2017; Site 63 data collected 2018–2021.

Juvenile Fish Abundance and Condition

In 2021, we captured fewer Dolly Varden char at Site 63 than at Site 54, as occasionally observed previously; generally, the number of Dolly Varden char captured during a single trapping event has been similar among Greens Creek sample sites since sampling began in 2001 (Figure 34). We captured several age classes of Dolly Varden char at all sites most years, and mean fish condition was similar among sites each year, about 1.0. We captured one juvenile coho salmon at Site 54 in 2021, the fewest observed since HGCMC repaired the Greens Creek fish pass in 2016.

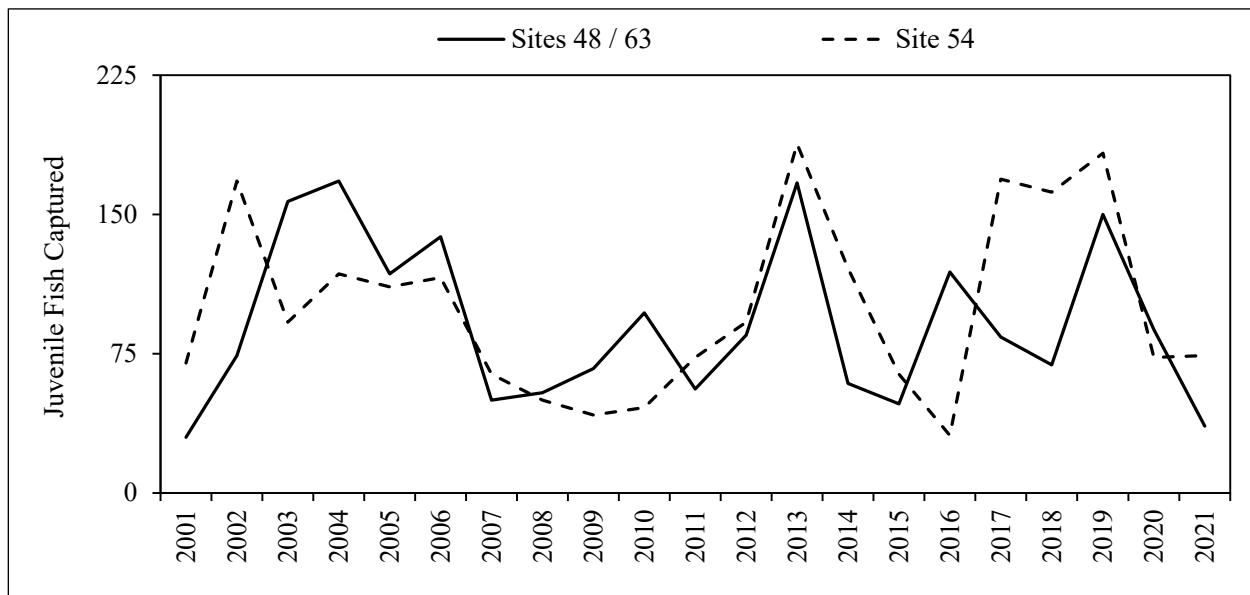

Figure 34.—Greens Creek Dolly Varden char captured, 2001–2021.

Note: Site 54 2001–2010 data extrapolated to 50 m sample reach for comparison. Site 48 data collected 2001–2017, and Site 63 data collected 2018–2021.

Juvenile Fish Element Concentrations

Among the 2021 Greens Creek Site 63 and Site 54 whole body Dolly Varden char element concentrations, we found no significant differences in median element concentrations.

COMPARISONS AMONG SITES

Juvenile Fish Element Concentrations

In 2021, samples collected at Tributary Creek Site 9 contained greater median concentrations of Ag, Hg, Pb, and Se than observed at Greens Creek sampling sites, and lower median concentrations of Cd, Cu, and Zn (Figure 35). Since 2001, samples collected at Tributary Creek Site 9 contained greater concentrations and variability than the Greens Creek samples, except Cu and Zn which were generally greater at Greens Creek sites (Figures 36, 37).

Among 2021 samples, most median element concentrations were within the range of values reported for sample sites with mining-related influence elsewhere in Alaska (Legere and Timothy 2016). As observed in previous years, median concentrations of Hg at Tributary Creek Site 9 and Zn at Greens Creek Sites 63 and 54 were greater than median values for reference and exploration sites.

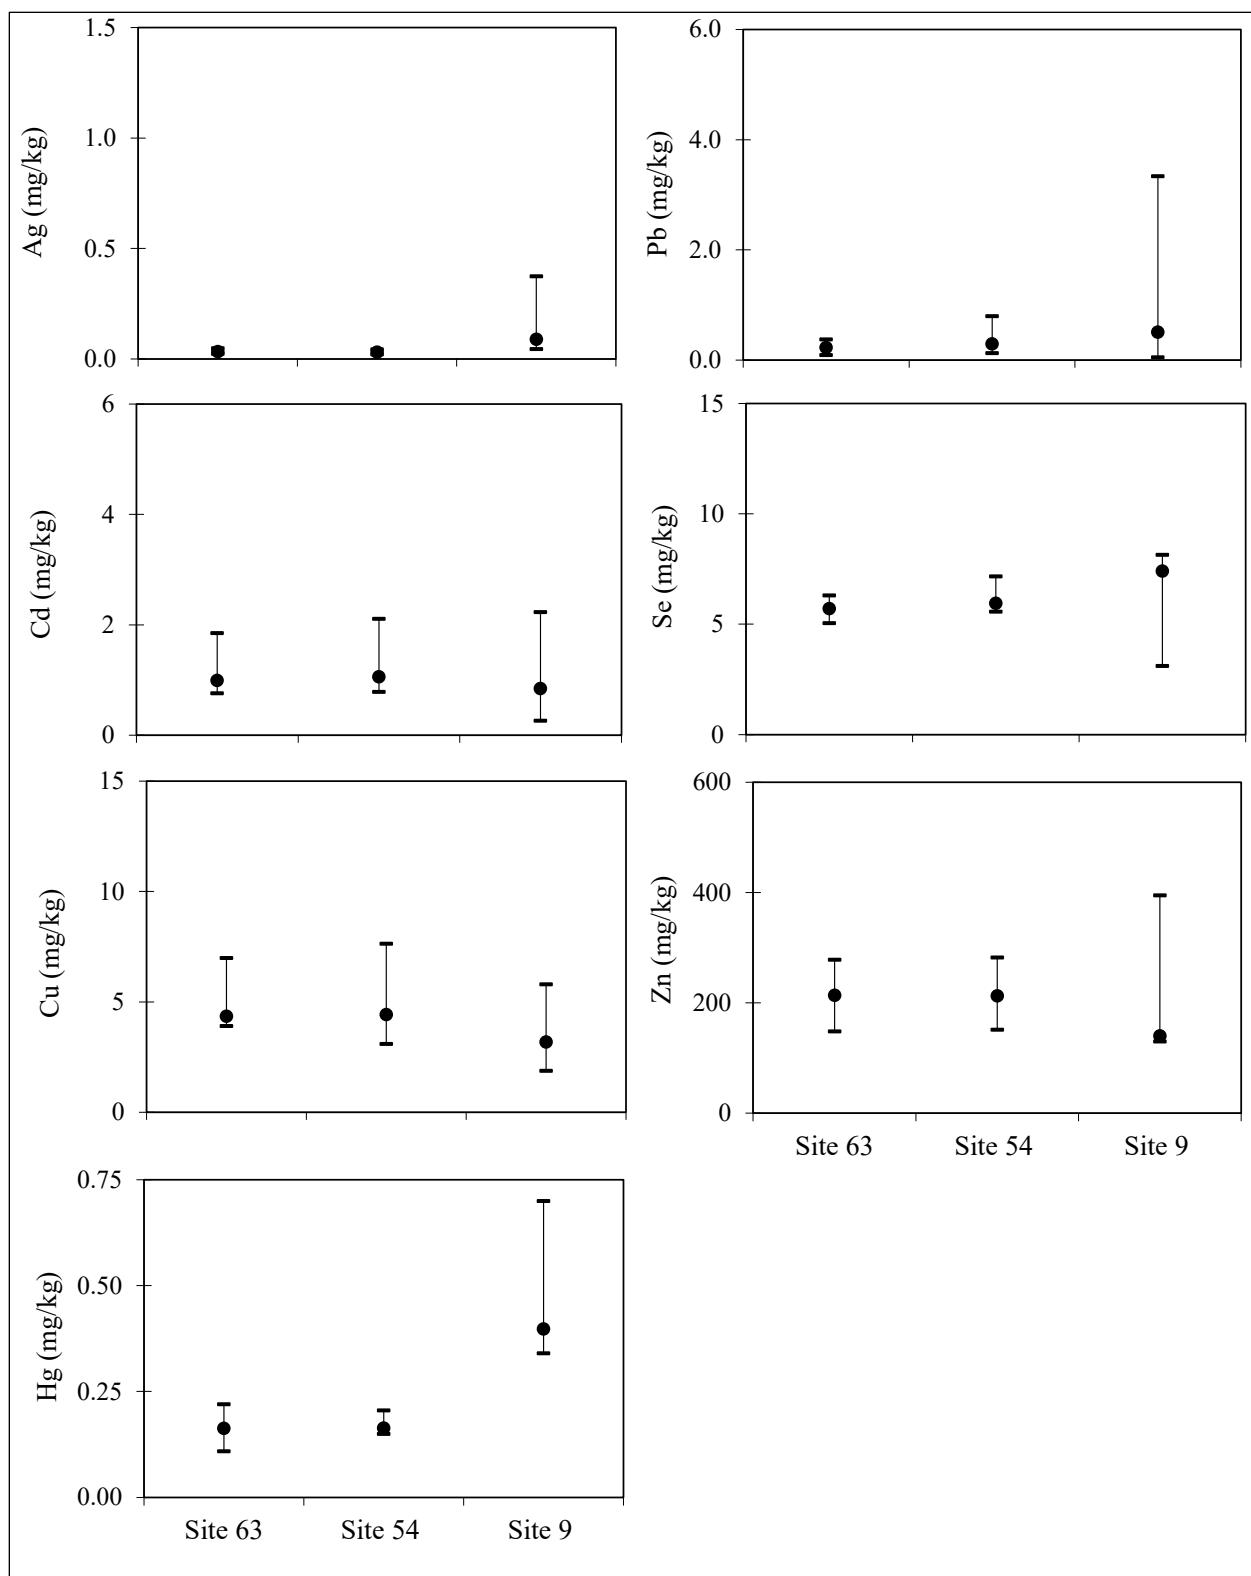

Figure 35.—Greens Creek and Tributary Creek whole body Dolly Varden char element concentrations, 2021.

Note: Minimum, median, and maximum whole body concentrations presented.

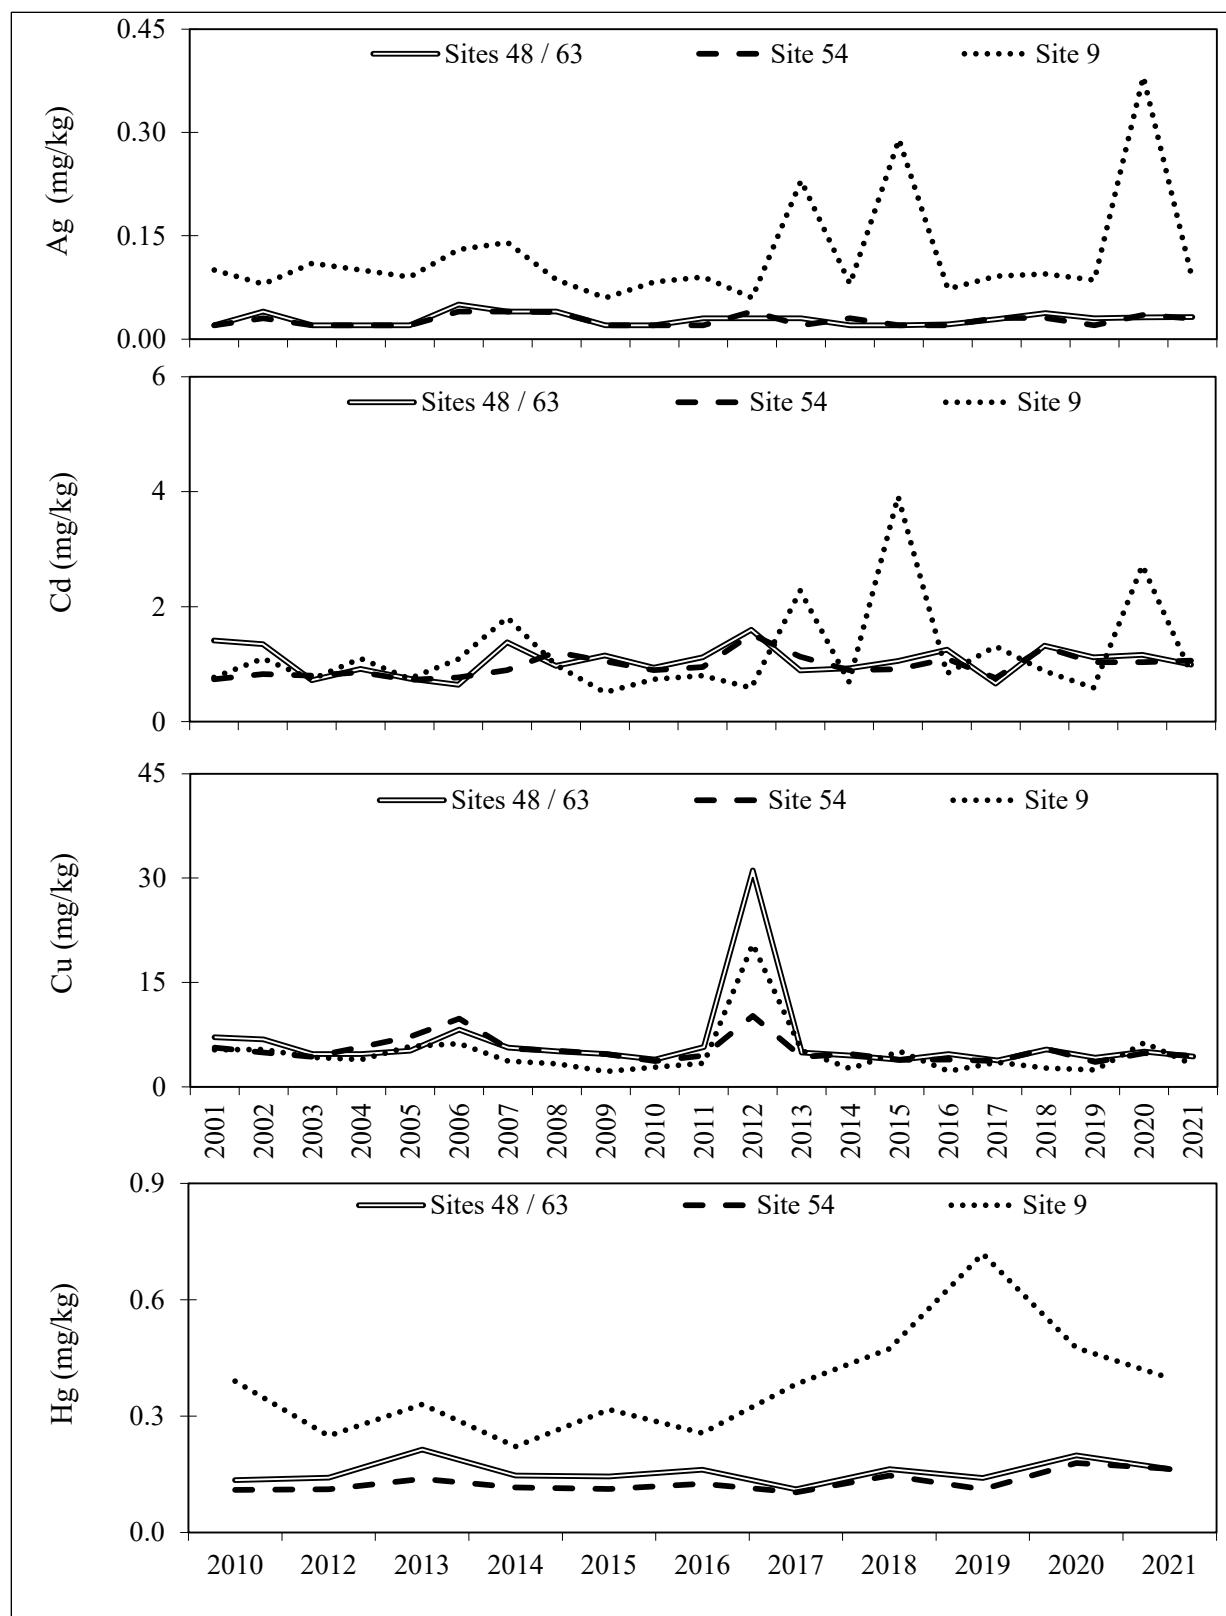

Figure 36.—Greens Creek and Tributary Creek whole body Dolly Varden char median Ag, Cd, and Cu concentrations, 2001–2021, and median Hg concentrations, 2010, 2012–2021.

Note: Solid line 2001–2017 is Site 48; 2018–2021 is Site 63.

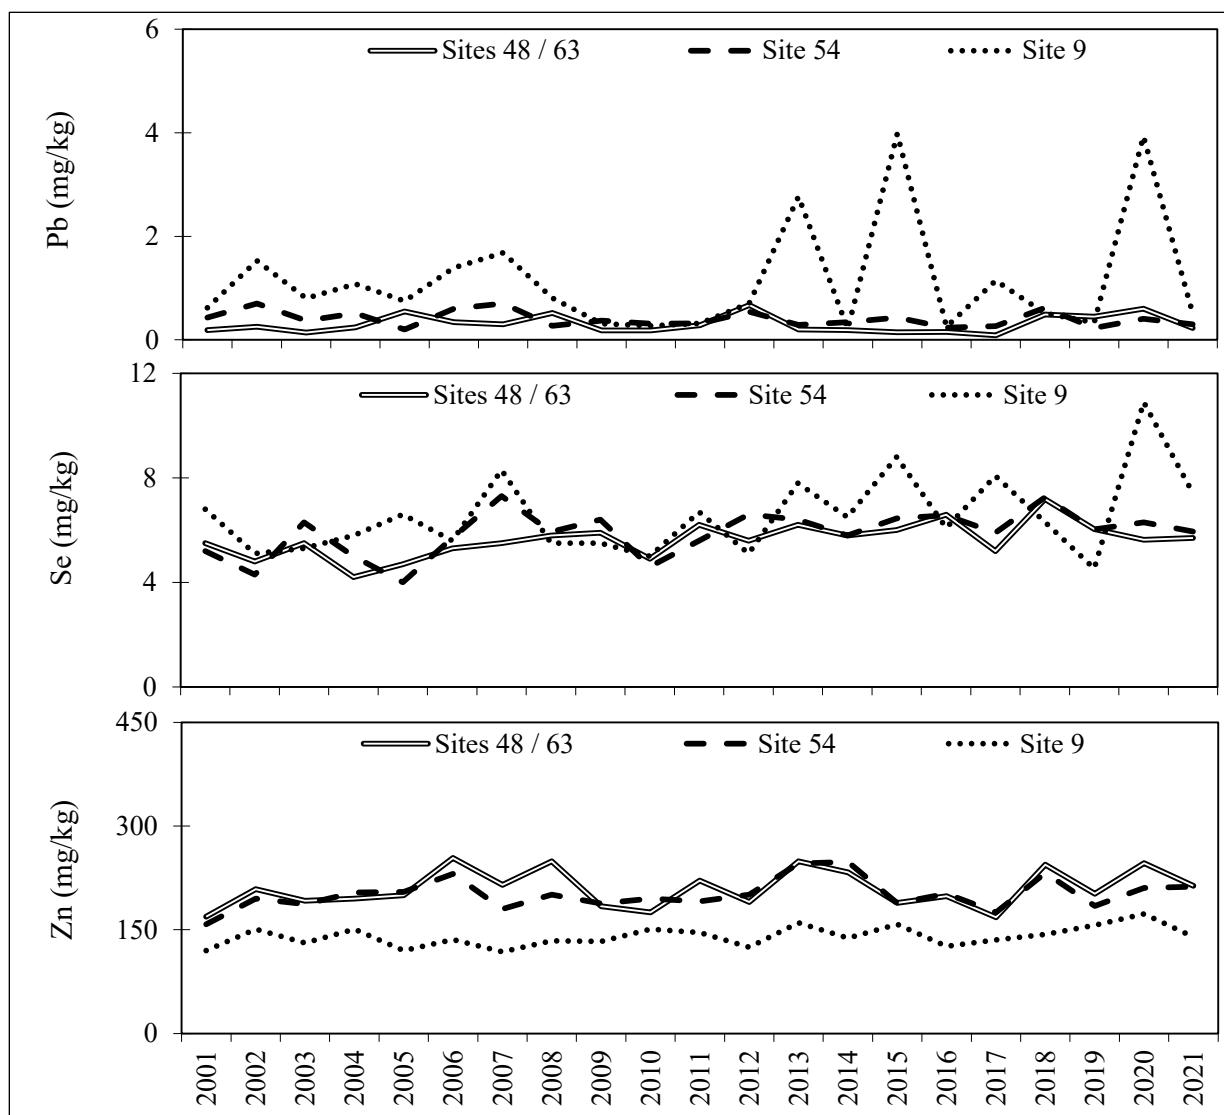

Figure 37.—Greens Creek and Tributary Creek whole body Dolly Varden char median Pb, Se, and Zn concentrations, 2001–2021.

Note: Solid line 2001–2017 is Site 48; 2018–2021 is Site 63.

RE: 2021 Greens Creek Mine Biomonitoring

Dear Bill,

Enclosed are the results of the sample(s) submitted to our laboratory August 18, 2021
For your reference, these analyses have been assigned our service request number **K2109642**.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3376. You may also contact me via email at Mark.Harris@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

A handwritten signature in black ink, appearing to read "Mark D. Harris".

Mark Harris

Table of Contents

- Acronyms
- Qualifiers
- State Certifications, Accreditations, And Licenses
- Case Narrative
- Chain of Custody
- Total Solids
- Metals

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated value.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.
- H The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

- # The control limit criteria is not applicable. See case narrative.
- J The result is an estimated value.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.
- Q See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimated value.
- J The result is an estimated value.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.alsglobal.com or at the accreditation bodies web site.

Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/analyte is offered by that state.

www.alsglobal.com

Client: Alaska Department of Fish and Game
Project: 2021 Greens Creek Mine Biomonitoring
Sample Matrix: Animal Tissue

Service Request: K2109642
Date Received: 08/18/2021

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier II level requested by the client.

Sample Receipt:

Fifty six animal tissue samples were received for analysis at ALS Environmental on 08/18/2021. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at minimum in accordance with the analytical method requirements.

Metals:

Method 6020A, 09/24/2021: Method Blanks KQ2118159-01 and KQ2118161-01 contained low levels of Copper above the Method Reporting Limit (MRL). The concentration of Copper in all of the associated field samples was greater than ten times the amounts measured in the Method Blanks so no additional corrective action was required.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.
